This page intentionally left blank.

1. SUMMARY

This appendix provides additional data used to calculate emissions generated by construction equipment and airport-related sources associated with the TBIT-RP.

1.1 Construction Emissions

This section provides additional data used to calculate emissions generated by off-road, on-road and on-site construction equipment and vehicles. The various input data and calculated emission inventories for construction activities are contained in Attachment 1 to this appendix. Included in Attachment 1 are tables of:

- Peak daily, quarterly, and annual emission summaries
- Equipment horsepower, load factors, operating hours, and emission factors
- PM10 to PM2.5 conversion factors for various source types
- Construction equipment exhaust CO, VOC,[1] NO_x, SO_x, PM10, PM2.5, and CO_2 emission inventories
- On-road haul/delivery truck trips, worker trips, and shuttle bus trips emission inventories
- Fugitive dust PM10 and PM2.5 emission inventories
- Paving and painting (striping and architectural coating) VOC emission inventories
- Emission rates of CO, VOC, NO_x, PM10, PM2.5 for use in dispersion modeling

1.2 Operational Emissions

This section provides additional data used to calculate emissions generated by aircraft, auxiliary power units (APUs), temporary heating and cooling equipment, passenger bus trips between TBIT and the gates at the West Remote Pads, and off-airport ground access vehicle traffic including passenger, employee, and cargo trips to and from LAX. The data and calculations used to determine the operational emissions inventory for the baseline year (2008), and the interim year (2013) with and without TBIT-RP construction are contained in Attachment 2 to this appendix. Included in Attachment 2 are tables of:

- Aircraft activity, bus operations, and total operational emissions by scenario year in tons
- Aircraft codes, descriptions, and engines for use in EDMS to generate aircraft and APU emission inventories
- Weather-weighted averages of arrival and departure taxi idle times by airframe and scenario year
- Temporary boilers and a temporary cooling tower emissions in pounds per day and tons per scenario year
- Bus trips and emission inventories in grams per day, pounds per day, and tons per scenario year
- Off-airport ground access vehicle traffic average daily VMT and emission inventories in lbs/day and tons per scenario year

1.3 Cumulative Emissions

This section provides additional data used to calculate emissions from other projects that might occur during the same time period as the TBIT-RP construction. The data and calculations used to determine the cumulative emissions inventory for projects occurring during the peak year and overall time period of TBIT construction are contained in Attachment 3 to this appendix. Included in Attachment 3 are tables of:

---

[1] The emissions of volatile organic compounds (VOC) and reactive organic gasses (ROG) are essentially the same for the combustion emission sources considered for the TBIT-RP. This appendix uses the acronyms VOC and ROG interchangeably.

- Peak daily, quarterly, and annual emission summaries
- Estimation of unknown project emissions by cost and emissions inventory of known projects
- Construction equipment exhaust CO, VOC, NO_x, SO_x, PM10, and PM2.5 emission inventories
- Period average, peak annual, and peak daily emission rates for all cumulative projects and staging areas for use in dispersion modeling
- Cumulative project emission inventories for ten on-airport construction projects occurring during the same period as the TBIT construction
- Emission factors for off-road equipment used in cumulative project emission inventories

1.4 Dispersion Modeling

This section provides the results of the AERMOD dispersion models used to determine the impacts of CO, VOC, NO_x, PM10, and PM2.5 emitted from TBIT-RP construction, operations, and cumulative projects construction. Attachment 4 to this appendix includes the plot files used to compare the concentrations of the criteria pollutants specified with the National Ambient Air Quality Standards (NAAQS), the California Ambient Air Quality Standards (CAAQS), and South Coast Air Quality Management District (SCAQMD) thresholds of significance. Also included are the results of the dispersion models used for the health risk assessment presented in Section 4.5 of the Bradley West Project EIR. Specifically included in Attachment 4 are results from the following models:

- CO - 1 hour and 8 hour averaged peak daily emissions
- NO_x - 1 hour averaged peak daily emissions and annual average of peak annual emissions
- PM10 - 24 hour average of peak daily emissions and annual average of peak annual emissions
- PM2.5 - 24 hour average of peak daily emissions
- Project average and 1 hour peak daily emissions for PM10 and VOC for the health risk assessment

17	CAT M14 Blade	Rubber Tired Dozer	Diesel	Offroad	259	320	53	0.59	0.85
18	Concrete Batch Plant / Crusher Plant	Crushing/Proc. Equipment	Diesel	Offroad	320	367	61	0.78	0.85
19	Concrete Pump - 36 Meter	Cement and Mortar Mixers	Diesel	Offroad	240	1	0	0.56	0.85
20	Concrete Truck - 16 Yd	HHDD Vehicle, Diesel (33,001 to 60,000 lb)	Diesel	Onroad	350	7	1	0.41	0.85
21	Crew Bus - 50 Passenger	HHDD Vehicle, Diesel (33,001 to 60,000 lb)	Diesel	Onroad	300	727	121	1.00	0.85
22	Crew Van - 9 Passenger	Passenger Vehicle, Gas (<8500 lb)	Gas	Onroad	180	288	48	1.00	0.85
23	Flat Bed Truck	Delivery Vehicle	Diesel	Onroad	180	217	36	0.41	0.85
24	Fueling Truck	HHDD Vehicle, Diesel (33,001 to 60,000 lb)	Diesel	Onroad	225	217	36	0.41	0.85
25	Generator - 50KW	Generator Sets	Diesel	Offroad	450	127	21	0.74	0.85
26	Gomaco GP-4000 Paver	Pavers	Diesel	Offroad	200	0	0	0.62	0.85
27	Gomaco RTP 500 Placer	Pavers	Diesel	Offroad	125	0	0	0.62	0.85
28	Gradall 544D Hi-Lift	Forklifts	Diesel	Offroad	185	251	42	0.30	0.85
29	Grove Hydraulic Crane - 50 Ton	Cranes	Diesel	Offroad	300	43	7	0.43	0.85
30	Grove Mobile Hydraulic Crane - 100Ton	Cranes	Diesel	Offroad	60	6	1	0.43	0.85
31	JLG 460SJ Work Platform	Aerial Lifts	Diesel	Offroad	15	15	3	0.51	0.85
32	Light Plant	Other General Industrial Equipment	Diesel	Offroad	400	0	0	0.62	0.85
33	Low Boy Truck / Trailer	HHDD Vehicle, Diesel (33,001 to 60,000 lb)	Diesel	Onroad	250	200	33	0.41	0.85
34	Maintenance Truck w/ Crane	HHDD Vehicle, Diesel (33,001 to 60,000 lb)	Diesel	Onroad	20	297	50	0.41	0.85
35	Man Basket Lift	Forklifts	Diesel	Offroad	600	10	2	0.30	0.85
36	Manitowoc 300 Ton Crane	Cranes	Diesel	Offroad	120	0	0	0.43	0.85
37	Miller Arc Welder - 300 Amp	Welders	Diesel	Offroad	40	386	64	0.45	0.85
38	Pickup Truck	Passenger Vehicle, Gas (<8500 lb)	Gas	Onroad	450	1,370	228	1.00	0.85
39	Platform Man-Lift - 2000 Lbs	Aerial Lifts	Diesel	Offroad	175	0	0	0.51	0.85
40	Semi_End Dump	Dumpers/Tenders	Diesel	Offroad	200	103	17	0.38	0.85
41	SUV	Passenger Vehicle, Gas (<8500 lb)	Gas	Onroad	240	617	103	1.00	0.85
42	Vacuum Sweeper	Sweepers/Scrubbers	Diesel	Offroad	170	665	111	0.68	0.85
43	Water Truck - 2000 Gal	HHDD Vehicle, Diesel (33,001 to 60,000 lb)	Diesel	Onroad	225	585	98	0.41	0.85

a. Load factors from CEQA Air Quality Handbook, SCAQMD, Diamond Bar, CA, 1993. Table A9-8-D.
b. Usage factor estimated by assuming 10 hour shift includes 1.5 hours down time for meal and breaks.
Passenger and employee vehicles assumed a load factor of 1
Trucks load factors assumed to be off-highway trucks

SCAQMD Emission Factors

[a] EMFAC factors for 2010 HHDD diesel vehicles used.
[b] Per LAX Development Program Memo (14-Nov 2008) and Resource spreadsheet (West Bradley Resource Loaded Schedule 082410.xls),

[c] 78 days/ quarter based on approximately 6 days per week.
Source: http://www.aqmd.gov/ceqa/handbook/onroad/onroad.html

Highest (Most Conservative) EMFAC2007 (version 2.3)
Emission Factors for On-Road Passenger Vehicles & Delivery Trucks
Derived from Peak Emissions Inventory (**Winter**, **Annual**, **Summer**)
Emission factors were compiled by running the California Air Resources Board's EMFAC2007 (version 2.3) Burden Model, taking the weighted average of vehicle types and simplifying into two categories: Passenger Vehicles & Delivery Trucks.

350

These emission factors can be used to calculate on-road mobile source emissions for the vehicle categories listed in the tables below, by use of the following equation:
Emissions (pounds per day) = N x TL x EF
where N = number of trips, TL = trip length (miles/day), and EF = emission factor (pounds per mile)

This methodology replaces the old EMFAC emission factors in Tables A-9-5-J-1 through A-9-5-L in Appendix A9 of the current SCAQMD CEQA Handbook. All the emission factors account for the emissions from start, running and idling exhaust. In addition, the VOC emission factors include diurnal, hot soak, running and resting emissions, and the PM10 & PM2.5 emission factors include tire and brake wear.

Emission Factors for On-Road Heavy-Heavy-Duty Diesel Trucks
Projects in the SCAQMD
Derived from Peak Emissions Inventory (**Winter**, **Annual**, **Summer**)
Vehicle Class: Heavy-Heavy-Duty Diesel Trucks (33,001 to 60,000 pounds)
The following emission factors were compiled by running the California Air Resources Board's EMFAC2007 (version 2.3) Burden Model and extracting the Heavy-Heavy-Duty Diesel Truck (HHDT) Emission Factors.

These emission factors can be used to calculate on-road mobile source emissions for the vehicle/emission categories listed in the tables below, by use of the following equation:
Emissions (pounds per day) = N x TL x EF
where N = number of trips, TL = trip length (miles/day), and EF = emission factor (pounds per mile)

The HHDT-DSL vehicle/emission category accounts for all emissions from heavy-heavy-duty diesel trucks, including start, running and idling exhaust. In addition, VOC emission factors account for diurnal, hot soak, running and resting emissions, and the PM10 & PM2.5 emission factors account for tire and brake wear.

The HHDT-DSL, Exh vehicle/emission category includes only the exhaust portion of PM10 & PM2.5 emissions from heavy-heavy-duty diesel trucks.

a. Controls assumed to be part of the project design to comply with SCAQMD Rules 1157 and 403; Fugitive mitigation assumes 61% reduction (watering 3 times per day) for construction activity.
b. Construction site demolition and excavation fugitive dust emissions calculated for Phases 1A - 9A from URBEMIS 2007 v.9.2.4.
c. USEPA AP42 Emission Factor 11.19.2-2 - Crushed Stone Processing and Pulverized Mineral Processing (August 2004); 100 tons/day assumed to be maximum daily crushing/screening rate.
d. USEPA AP42 Emission Factor 11.12 - Concrete Batching (June 2006).
e. EPA's Fugitive Dust Background Document and Technical Information Document for Best Available Control Measures (September 1992) Appendix F, Construction and Operational Emission Calculation Methodologies, Equation F-4 and Table F-4; and SCAQMD CEQA Handbook, Table A9-9-E.

a. Controls assumed to be part of the project design to comply with SCAQMD Rules 1157 and 403; Fugitive mitigation assumes 61% reduction (watering 3 times per day) for construction activity.
b. Construction site demolition and excavation fugitive dust emissions calculated for Phases 1A - 9A from URBEMIS 2007 v.9.2.4.
c. USEPA AP42 Section 11.19.2-2 - Crushed Stone Processing and Pulverized Mineral Processing; 100 tons/day assumed to be maximum daily crushing/screening rate.; PM2.5/PM10 size ratios from CEIDARS PM Profile size fractions for screening, crushing, and construction dust.
d. USEPA AP42 Section 11.12 - Concrete Batching (June 2006).
e. EPA's Fugitive Dust Background Document and Technical Information Document for Best Available Control Measures (September 1992) Appendix F, Construction and Operational Emission Calculation Methodologies, Equation F-4 and Table F-4; and SCAQMD CEQA Handbook, Table A9-9-E; F

Screening Rock	*0.87*	*0.26*	*0.074*	*0.005*
Tertiary Rock Crushing	*0.24*	*0.07*	*0.054*	*0.010*
Conveyor Point (assumes 1)	*0.11*	*0.02*	*0.005*	*0.001*
Max Daily Total	1.22	0.35	0.133	0.016
	Uncontrolled (tons/qrtr)		*Controlled (tons/qrtr)*	
Rock Crushing - Quarterly	0.0476	0.0138	0.0052	0.0006

USEPA AP42 Emission Factor 11.19.2-2 - Crushed Stone Processing and Pulverized Mineral Processing; 100 tons/day assumed to be maximum daily crushing/screening rate.

Controlled factors Assumed   Quarter assumed to be 78 days   100 tons/day
1000 tpd crushing rate assumed.

LAX TBIT
PM10 from Storage Piles

Storage piles are assumed to be generated by each activity, and each pile is assumed to be the same size.

PM10 Emissions (lb/day) = (0.85 x (s/1.5) x ((365-p)/235) x (UW/15) x A)

Silt Content (% wt) (s)	6.9	ASTM Test Method default
Days of Rain per Year (>0.01 in) (p)	34	SCAQMD Meteorological Records
Wind Speed (% of Time > 12 MPH) (UW)	95%	SCAQMD Assumption
Storage Pile Size (acres) (A)	2	Assumption
Mitigation:	63%	Soil Stabilizers
PM10 Emissions (lb/day/pile)	**0.70**	**Uncontrolled**
PM10 Emissions (lb/day/pile)	**0.26**	**Controlled**

Notes:
Source: EPA's Fugitive Dust Background Document and Technical Information Document for Best Available Control Measures (September 1992)
Appendix F, Construction and Operational Emission Calculation Methodologies, Equation F-4 and Table F-4. 1993 CEQA Handbook, Table A9-9-E

Batch Plant Emissions

Concrete batch plant (central mix type):

Batch plant production rate:	350	batches (cubic yards or CY) per hour (estimate)	moisture, lbs	
Aggregate per batch:	1865	pounds per batch or per cubic yard (AP-42, Table 11.12-2, footnote "a")	33.0105	= 1.77%, per Table 11.12-2, footnote b.
Sand per batch:	1428	pounds per batch or per cubic yard (AP-42, Table 11.12-2, footnote "a")	59.5476	= 4.17%, per Table 11.12-2, footnote b.
Cement per batch:	491	pounds per batch or per cubic yard (AP-42, Table 11.12-2, footnote "a")		
Cement supplement per batch:	73	pounds per batch or per cubic yard (AP-42, Table 11.12-2, footnote "a")		
Total dry (aggregate, sand, cement, supplement)	3857	lbs per CY		
Total (Total dry + moisture)	3950	lbs per CY		
PM10 emissions factor, central mixer loading:	0.0048	lb/ton of aggregate, sand, cement, supplement, and moisture (controlled). Mixer loading (central mix) (controlled), AP-42, Table 11.12-1 (Emission Factors for Concrete Batching)		
PM2.5 emissions factor, central mixer loading:	0.00072	lb/ton of aggregate, sand, cement, supplement, and moisture (controlled). AP-42, Table 11.12-3 (Equation parameters for Central Mix Operations). Ratio of particle size multipliers.		
PM10 emissions factor, cement unloading into silo:	0.00034	lb/ton of cement (controlled). Mixer loading (central mix) (controlled), AP-42, Table 11.12-1 (Emission Factors for Concrete Batching)		
PM2.5 emissions factor, cement unloading into silo:	0.000051	lb/ton of cement (controlled). AP-42, Table 11.12-3 (Equation parameters for Central Mix Operations). Ratio of particle size multipliers.		
PM10 emissions factor, supplement unloading into silo:	0.0049	lb/ton of cement supplement (controlled). Mixer loading (central mix) (controlled), AP-42, Table 11.12-1 (Emission Factors for Concrete Batching)		
PM2.5 emissions factor, supplement unloading into silo:	0.00074	lb/ton of cement supplement (controlled). AP-42, Table 11.12-3 (Equation parameters for Central Mix Operations). Ratio of particle size multipliers.		
PM10 emissions (plant-wide):	3.4094	lb/hr		
PM2.5 emissions (plant-wide):	0.5114	lb/hr. Calculated based on PM10 rate and ratio of particle size multipliers from AP-42, Section 13.2.4.3.		
PM10 emissions, plant-wide:	**3.4094**	**lb/hr** **controlled**		
PM2.5 emissions, plant-wide:	**0.5114**	**lb/hr** **controlled**

1. INTRODUCTION

1.1 Purpose

This report presents the human health risk assessment (HHRA) for Bradley West Project construction and operation activities compared to baseline (2008) conditions. Construction is anticipated to start at the end of 2009 and extend through the beginning of 2015, while Bradley West Project-specific operational sources are anticipated to start in 2013, after most of the Bradley West Project construction is completed and the concourses are fully operational. The LAX Master Plan Final EIR[1] previously examined incremental health risks due to inhalation of toxic air contaminants (TACs)[2] from operational sources associated with four build alternatives and the No Action/No Project Alternative (see Technical Report 14a of the LAX Master Plan Final EIR). Incremental impacts were those impacts above 1996 environmental baseline conditions. Because project-level details were not available regarding construction phasing, the programmatic level LAX Master Plan Final EIR did not address health risk associated with construction activities of any of the individual LAX Master Plan components, including the Bradley West Project.

Although the LAX Master Plan Final EIR analyzed future operational impacts, several operational sources are included in this Bradley West Project HHRA. The sources included are those that would have different operating characteristics after completion of the Bradley West Project than after full implementation of the LAX Master Plan. Specifically, the gates at the West Remote Pads would continue to be utilized after completion of the Bradley West Project, although at a much lower level than without the project. These gates would be taken out of service after full buildout of the LAX Master Plan. In addition, heating and cooling capacity would be added to TBIT as part of the project to address the incremental demand specific to the Bradley West Project. Therefore, operational emissions associated with aircraft activity on the ground at LAX, with transporting passengers between TBIT and the gates at the West Remote Pads, and with TBIT heating and cooling units were analyzed for 2013 with and without the project as well as for 2008 baseline conditions as discussed in Section 4.4, *Air Quality,* of the Bradley West Project Draft EIR. Therefore, this EIR includes a quantitative evaluation of possible impacts to human health associated with both construction activities and subsequent Bradley West Project-specific operations. Emissions evaluated in this HHRA include emissions from on-airport construction sources (e.g., construction equipment, batch plant, rock crusher, and fugitive dust) and on-airport Bradley West Project-specific operational sources, including aircraft, in 2013, when the main Bradley West Project improvements are in place.

Evaluation of human health risk impacts associated with the Bradley West Project focuses on exposure to TAC emissions generated by construction activities and Bradley West Project-specific operational changes. Existing baseline risk associated with construction sources is zero because construction activities have not yet started and no construction emissions would occur under a no-project scenario.

Operations as a whole for LAX are forecast to decrease in the short term due to market conditions, compared to the 1996 baseline used for the LAX Master Plan Final EIR: however, by 2013, Bradley West Project-specific operations may result in an increase in emissions from aircraft compared to the 2008 baseline condition. These Project-specific operational sources are those sources that would have different operating characteristics after completion of the Bradley West Project than after full implementation of the LAX Master Plan, and thus they were not evaluated in the LAX Master Plan Final EIR. For this reason, operational emissions specific to the Bradley West Project are addressed in this HHRA as incremental increases over 2008 baseline conditions.

---

[1] City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004.

[2] In the LAX Master Plan Final EIR, these were referred to as toxic air pollutants (TAPs). In this EIR, the term "toxic air contaminants," or TACs, is used to reflect California regulatory terminology.

In summary, this HHRA addresses potential impacts to human health associated with releases of TACs that would occur during the construction period of the Bradley West Project and subsequent operations. Possible human health risks associated with the Bradley West Project are estimated using modeled TAC concentrations in air and standard methods developed by California Environmental Protection Agency (CalEPA) and U.S. Environmental Protection Agency (USEPA). Health impacts were evaluated for cancer risks and non-cancer chronic and acute health hazards. An impact was considered significant if cancer or non-cancer hazards exceeded regulatory thresholds.

1.2 General Approach

This HHRA focuses analysis of human health risks associated with TAC emissions from Bradley West Project construction and Bradley West Project-specific operational sources. Evaluation of cancer risk, chronic non-cancer hazard, and acute non-cancer hazard in this HHRA consists of two components: (1) estimation of emissions of TACs associated with project construction and Bradley West Project-specific operations not previously assessed, and subsequent modeling of dispersion of those emissions to downwind receptor locations; and (2) estimation of health risks associated with inhalation of TAC at these locations.. The HHRA addresses construction phasing for the Bradley West Project at LAX (i.e., late 2009 through early 2015).and some operational activities after most construction is complete in 2013.

To accomplish the first step, this HHRA estimated possible future emissions associated with Bradley West Project construction and operation. Estimated future emissions were then used as inputs, along with meteorological and geographic information, to an air dispersion model. The model predicted potential future concentrations of TACs within the study area around the airport.

Potential impacts to human health were then estimated using modeled TAC concentrations in air and methods developed by the CalEPA and the USEPA, as described below. Health impacts were evaluated for cancer, chronic non-cancer, and acute non-cancer health impacts.

Results of the analyses were interpreted by comparing estimated cancer risks and non-cancer hazards to regulatory thresholds. These comparisons were made for maximally exposed individuals (MEI) at locations where maximum concentrations of TACs were predicted by air dispersion modeling, and for all modeled locations within the defined study area. An impact was considered significant[3] if risks or hazards to MEI exceeded regulatory thresholds. Initially, off-site receptors (residents, workers, and students) were assessed only at locations of maximum predicted concentrations (1-hour or annual average). If concentrations of chemicals released during the Bradley West Project were below levels of concern at points of greatest impact (typically along the fence-line), then impacts would not be anticipated for other locations where concentrations would be lower. However, risks and hazards were assessed at nearby schools to provide direct information on potential construction impacts on students, faculty, and staff at these locations.

Methods for estimating cumulative impacts followed the approach used for the LAX Master Plan Final EIR. The present analysis, however, uses findings from the Multiple Air Toxics Exposure Study in the South Coast Air Basin (MATES-III) completed by the South Coast Air Quality Management District (SCAQMD) to evaluate cumulative cancer risks instead of information from the older MATES-II study. The analysis again used data presented in USEPA's National Air Toxics Assessment to evaluate cumulative chronic, non-cancer health hazards. For cumulative, acute non-cancer hazards, conservative (likely to overestimate) approximations of short-term concentrations were made using generic conversion factors and the annual average estimates of acrolein and formaldehyde in air from USEPA. The estimates are subject to much uncertainty, as further described in Section 5 of this appendix, but can be used to provide a semi-quantitative evaluation of the possible range of cumulative impacts.

In addition, cumulative impacts were assessed for construction impacts for the LAX Master Plan projects (such as the CFTP), as well as several non-Master Plan projects, that are expected to overlap the Bradley

[3] The term "significant" is used as defined under CEQA regulations and does not imply an independent judgment of the acceptability of risks or hazards.

West Project construction. Construction emissions for these projects were obtained from environmental documents prepared for these projects, where such documents were available, or were developed based on estimated equipment inventories. Based on these data, it was possible to address the combined impacts of emissions from concurrent releases of TACs for projects implemented in overlapping time frames by a comparison of emission rates during the time when construction of the projects would be ongoing concurrently. Most of these projects, once completed, do not impact airport operations. In addition, due to the uncertainty of the timing and operations of these other airport projects and non-airport projects, operational emissions from these projects were not included in the cumulative analysis.

Methods for conducting this HHRA are presented in Section 2; TAC emission calculation approach and results and a discussion of the dispersion analysis are presented in Section 3; associated health risks are presented in Section 4; and uncertainties are discussed in Section 5.

This page intentionally left blank.

2. METHODOLOGY

The HHRA was conducted based on total TAC emissions associated with Bradley West Project construction and Bradley West Project-specific operational activities. The environmental baseline for construction was assumed to be zero emissions, because in the absence of Bradley West Project, no construction emissions would occur. However, as discussed above, Bradley West Project-specific operational changes (not previously evaluated in the LAX Master Plan Final EIR) were evaluated as incremental impacts over the 2008 environmental baseline. The HHRA was conducted in four steps as defined in SCAQMD, CalEPA, and USEPA guidance[4,5,6] consisting of:

- Identification of chemicals (in this case, TACs) that may be released in sufficient quantities to present a public health risk (Hazard Identification)
- Analysis of ways in which people might be exposed to chemicals (TACs) (Exposure Assessment)
- Evaluation of the toxicity of chemicals (TACs) that may present public health risks (Toxicity Assessment)
- Characterization of the magnitude and location of potential health risks for the exposed community (Risk Characterization)

Analyses for the Bradley West Project Draft EIR address the following issues, and provide additional information on potential for human health impacts:

- Quantitative assessment of potential chronic human health impacts due to release of TACs associated with Bradley West Project construction and subsequent operational activities.
- Quantitative evaluation of possible acute non-cancer hazards due to release of TACs during the approximately 5-year construction period and during subsequent operations associated with the Bradley West Project.

Conservative methods were used to estimate human health risks and hazards. That is, methods were used that are likely to overestimate rather than underestimate possible health risks. For example, risks associated with Bradley West Project construction and Bradley West Project-specific operational activities were calculated for individuals where TAC concentrations are predicted to be highest (maximally exposed individual or MEI). Further, these individuals were assumed to be exposed to TACs for almost all days of the year and for many years to maximize estimates of possible exposure.

The HHRA also evaluates the potential for short-term (1-hour) exposures to cause immediate, or acute, health impacts. Resulting risk estimates represent upper-bound predictions of exposure, and therefore health risk, which may be associated with living near, and breathing emissions from, LAX during construction and operation of the Bradley West Project. By protecting hypothetical individuals that receive the highest exposures, the risk assessment is also protective for actual members of the population near LAX that would not be as highly exposed.

6 U.S. Environmental Protection Agency, Office of Emergency and Remedial Response, Risk Assessment Guidance for Superfund, Vol. I, Human Health Evaluation Manual (Part A), Interim Final, EPA/540/1-89/002, December, 1989.

Generally, methods used in preparation of the assessment provided in the LAX Master Plan Final EIR, as described in Technical Reports 14a and S-9a of that EIR, were used in this analysis. The LAX Master Plan Final EIR concluded that emissions of 1,3-butadiene, benzene, formaldehyde, and acrolein from aircraft, and of diesel particulates from ground support equipment as well as from trucks and construction equipment, are responsible for nearly all potential health risks posed by airport operations. Based on analysis of cumulative impacts, the LAX Master Plan Final EIR concluded that the airport is a relatively minor source of these TACs, and that improvements in airport operations as a result of implementing the LAX Master Plan, of which the Bradley West Project is a part, could reduce the overall contribution of the airport to TAC emissions below that anticipated in the absence of improvements at the airport, i.e., the No Action/No Project Alternative.

2.1 Selection of TACs of Concern

TACs of concern used in this HHRA were based on the list developed for the LAX Master Plan Final EIR, as described in Technical Report 14a, Section 3, of that EIR. TACs of concern for the LAX Master Plan were selected based on identification of chemicals as TACs in federal and state regulations, current or future presence in emissions at LAX, magnitude of possible emissions, and toxicity. Since the release of the LAX Master Plan Final EIR, current technical literature has not indicated a change in the selection process is needed; therefore, the previous selection process remains valid.

However, to focus the Bradley West Project HHRA analysis on those TACs most likely to produce substantial risks, the Long Beach Airport Terminal Area Improvement Project Draft EIR,[7] LAX South Airfield Improvement Project (SAIP) Draft EIR,[8] LAX CFTP Draft EIR,[9] LAX Master Plan Final EIR,[10] Oakland International Airport - Airport Development Program (ADP) Draft Supplemental EIR,[11] and the Civilian Reuse of MCAS El Toro Draft EIR, Draft Supplemental Analysis[12] were reviewed. These documents represent the most recent EIRs conducted in California that assessed potential human health risk from airport operations.

The Long Beach Airport Terminal Area Improvement Project Draft EIR indicated that diesel particulate matter, 1,3-butadiene (to a lesser extent), and hexavalent chromium were the drivers of cancer risks for residents. Diesel particulate matter accounted for 65 to 87 percent and hexavalent chromium accounted for 9 to 30 percent of the cancer risk, depending on the receptor and the horizon year evaluated. Chronic non-cancer hazards for residents were mainly due to possible exposure to acrolein, (36-42 percent) and to a lesser extent, manganese (28-33 percent) and formaldehyde (16-18 percent). Acrolein accounted for nearly all acute risks.

The LAX SAIP Draft EIR indicated that diesel particulate matter, 1,3-butadiene, formaldehyde, and benzene were the drivers of cancer risks. Diesel particulate matter accounted for 6 to 37 percent and 1,3-butadiene accounted for 42 to 62 percent of the cancer risk, depending on the receptor. Acrolein accounted for approximately 97 percent of the chronic non-cancer hazard and most acute risks.

The LAX CFTP Draft EIR indicated that diesel particulate matter was the driver of cancer risks associated with construction impacts. Diesel particulate matter accounted for up to 83 percent of the cancer risk,

depending on the receptor. Diesel particulate matter accounted for approximately 37 percent of the chronic non-cancer hazard. Naphthalene (13 percent), manganese (8 percent), and chlorine (32 percent) also contributed significantly to the total chronic non-cancer hazard. Acute risks were due primarily to exposure to formaldehyde.

The LAX Master Plan Final EIR, Technical Report 14a, Table 9, provided cancer risk for the No Action/No Project Alternative in 2005. Residential cancer risks were driven by diesel particulate matter (70 to 72 percent), 1,3-butadiene (15 percent), benzene (10 to 11 percent), and formaldehyde (2 to 3 percent). Non-cancer chronic health hazards were driven by acrolein (70 to 100 percent), diesel particulate matter (up to 2 percent), and acetaldehyde, naphthalene, and manganese (up to 1 percent each).

The Oakland International Airport ADP Draft Supplemental EIR, Appendix E, indicated that diesel particulate matter, 1,3-butadiene, benzene, acrolein, and formaldehyde were the drivers of cancer and non-cancer risks. Diesel particulate matter accounted for 54 to 60 percent and 1,3-butadiene accounted for 23 percent of the cancer risk. Acrolein accounted for approximately 75 percent of the chronic non-cancer hazard, with some contribution from formaldehyde. Acrolein also accounted for most acute risks.

The MCAS El Toro Draft Supplemental Analysis, Section 2.17, provided cancer and non-cancer risks for the proposed Orange County International Airport. The analysis indicated that diesel particulate matter contributed approximately 86 percent to the cancer risk, with various volatile organic compounds (VOCs) contributing 9 percent and metals contributing 5 percent. Non-cancer hazards were primarily attributable to acrolein. The report also indicated that diesel particulate matter and chromium were the primary drivers of cancer risk associated with operations at John Wayne Airport.

Based on this review and California Air Resources Board (CARB)-preferred speciation profiles (see discussion in Section 3.1 of this appendix), the original list of TACs included in the detailed HHRA prepared for the LAX Master Plan Final EIR was modified for the Bradley West Project HHRA. TACs of concern for the LAX Master Plan were reviewed to select TACs associated with construction and operational activities. From this specific list of TACs, TACs were further screened based on the availability of chronic or acute reference exposure levels (RELs), or cancer potency slopes from Cal EPA's Office of Environmental Health Hazard Assessment (OEHHA). Additional TACs (e.g., ammonium ion, and chlorine) identified as constituents in construction dust were included as TACs of concern to complete the analysis of construction and operations related acute risks. The final list of TACs of concern for the Bradley West Project is presented in **Table 1**. Emission estimates for individual TAC were developed by applying the appropriate CARB speciation profile to construction or operational source emissions of VOC and PM10. For construction sources, Organic Profile No. 818 was applied to diesel engine VOC emissions, Organic Profile No. 441 was applied to gasoline engine VOC emissions, Organic Profile No. 715 was applied to paving VOC emissions, Organic Profile No. 1811 was applied to taxiway/roadway painting and striping VOC emissions, Particulate Profile No. 425 was applied to diesel engine PM10 emissions, Particulate Profile No. 400 was applied to gasoline engine PM10 emissions, Particulate Profile No. 420 was applied to fugitive dust PM10 emissions, and Particulate Profile No. 343 was applied to concrete batch plant emissions. For operational sources, Organic Profile No. 3 was applied to external combustion boilers fueled with natural gas, Organic Profile No. 818 was applied to diesel-fueled equipment (passenger buses), and the FAA/EPA developed HAP profile for aircraft engine exhaust that is available in the FAA EDMS Version 5.1 model was applied to aircraft taxi/idle emissions. TAC inventories for operation source PM emissions were developed from Profile No. 121 for natural gas combustion, Profile No. 425 for diesel-fueled equipment, and Profile No.2 for water evaporation from the cooling towers. Finally, those TACs with acute OEHHA RELs were included in the acute health hazards assessment.

As discussed in the LAX Master Plan Final EIR,[13] acrolein is the TAC of concern that is responsible for essentially all predicted chronic non-cancer health hazards associated with LAX operations and is primarily associated with aircraft emissions. Acrolein is also the only TAC of concern in emissions from

---

LAX that might be present at concentrations approaching a threshold for acute effects and was therefore the only TAC evaluated for potential acute effects in the LAX Master Plan Final EIR. However, because Bradley West Project has both construction and operational sources, acute adverse health impacts for all TACs with RELs, not just acrolein, were evaluated so that potential impacts from construction emissions would also be assessed. TACs that do not have OEHHA-assigned RELs or cancer potency slopes are discussed qualitatively in the Uncertainties Section of this appendix.

Table 1

Toxic Air Contaminants of Concern for the Bradley West Project

Toxic Air Contaminant	Type
Acetaldehyde	VOC
Acrolein	VOC
Benzene	VOC
1,3-Butadiene	VOC
Ethylbenzene	VOC
Ethylene glycol	VOC
Formaldehyde	VOC
n-Hexane	VOC
Isopropyl alcohol	VOC
Methyl alcohol	VOC
Methyl ethyl ketone	VOC
Methyl t-butyl ether	VOC
Phenol	VOC
Propylene	VOC
Styrene	VOC
Toluene	VOC
Xylene (total)	VOC
Naphthalene	PAH
Antimony	PM-Metal
Arsenic	PM-Metal
Cadmium	PM-Metal
Chromium VI	PM-Metal
Copper	PM-Metal
Lead	PM-Metal
Manganese	PM-Metal
Mercury	PM-Metal

2.2 Exposure Assessment

The exposure assessment examines inhalation exposures to TACs of concern for several populations, consisting of on-airport workers, off-airport workers, resident children, school children, and resident adults. Analyses of cancer risk and non-cancer hazards, both chronic and acute, are included in the exposure assessment for these receptors. Chronic and acute exposure to TACs from Bradley West Project construction and Bradley West Project-specific operational activities has been estimated by:

- Estimation of construction and operation source emissions, both annual (for chronic exposure) and peak daily (for acute exposure)
- Dispersion analysis of the on-airport construction TAC emissions using AERMOD[14]

The anticipated duration of Bradley West Project construction is approximately 5 years. Construction-related sources of TAC emissions associated with the project include off-road heavy duty construction equipment,[15] on-road equipment and vehicles, generators, and construction material (e.g., VOCs from striping and asphalt paving). Changes to LAX operations due to the Bradley West Project are assumed to be permanent without a pre-set duration, even though use of the West Gates would cease with full build out of the Master Plan. Operation-related sources of TAC emissions associated with the project include: buses transporting passengers between the TBIT concourses and the remote West Gates, Bradley West Project utilities, and Bradley West Project-specific aircraft in the taxi/idle mode. Various models were used to estimate construction- and operational-related emissions, as described in Section 4.4 and Appendix E of the Bradley West Project Draft EIR.

AERMOD Version 07026 was used to model ambient TAC concentrations. Annual average TAC concentrations were calculated from annual (2009) construction and operation emissions for 451 grid nodes. Grid nodes were selected to represent locations where TAC concentrations may be highest as well as some additional locations in the surrounding community. One hundred and twenty (120) of these nodes are located on the LAX property line surrounding the construction site. Hourly concentrations were calculated using peak daily emission rates. The same meteorological data set used in the LAX Master Plan Final EIR, SAIP Final EIR, and CFTP Draft EIR was again used for dispersion modeling for the Bradley West Project.

Modeled concentrations at the fenceline locations with the predicted highest concentrations were then used to estimate cancer risk as well as chronic and acute non-cancer hazards. Risks and hazards were estimated using the same methods as used previously for the LAX Master Plan Final EIR and the LAX SAIP Draft EIR. Total risks associated with locations where a receptor (e.g. resident or worker) would receive the highest exposure serve as the basis of significance determinations.

2.3 Toxicity Assessment

Risks from exposure to TACs were calculated by combining estimates of potential exposure with toxicity criteria specific to each chemical. A toxicity assessment for TACs of concern was conducted for the LAX Master Plan Final EIR, as described in Technical Report 14a of that EIR. The conclusions of that assessment have not changed materially. As both the CalEPA's OEHHA and USEPA are continually updating toxicity values as new studies are completed, all toxicity information provided in Technical Report 14a was reviewed and updated as appropriate. Acute RELs developed by the State of California were used in the characterization of potential acute hazards associated with the Bradley West Project.

---

14 U.S. Environmental Protection Agency, User's Guide for the AMS/EPA Regulatory Model - AERMOD, EPA-454/B-03-001, September 2004.

15 Examples of off-road heavy duty construction equipment include scalpers, graders, backhoes, and rock crushers.

2.4 Risk Characterization

Cancer risks were estimated by multiplying exposure estimates for carcinogenic chemicals by corresponding cancer slope factors. The result is a risk estimate expressed as the odds of developing cancer. Commonly, risks (or odds) of developing cancer of one to ten in one million (1×10^{-6} to 10×10^{-6}) or less are considered de minimis.[16] Higher risks may be deemed significant in some instances.

Non-cancer hazard estimates were calculated by dividing exposure estimates by reference doses. Reference doses are estimates of highest exposure levels that would not cause adverse health effects even if exposures continue over a lifetime. The ratio of exposure to reference dose is termed the hazard quotient (HQ). A HQ greater than one indicates an exposure greater than that considered safe. Risks or odds of adverse effects cannot be estimated using references doses. However, because reference doses are developed in a conservative fashion, HQs only slightly higher than one are generally accepted as being associated with low risks (or even no risk) of adverse effects, and that potential for adverse effects increases as the HQ gets larger.

Acute non-cancer hazard estimates were calculated by dividing exposure estimates by a REL. The acute REL is a concentration in air below which adverse effects are for people, including sensitive subgroups, exposed for one hour on an intermittent basis. USEPA defines intermittent exposure as that lasting less than 24 hours and occurring no more than monthly.[17] RELs are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. Since margins of safety are incorporated to address data gaps and uncertainties, exceeding the REL does not automatically indicate an adverse health impact.

Impacts of exposure to multiple chemicals were accounted for by adding cancer risk estimates for exposure to all carcinogenic chemicals, and by adding estimated HQs for non-carcinogenic chemicals that affect the same target organ or tissue in the body. Addition of HQs for TACs that produce effects in similar organs and tissues results in a Hazard Index (HI) that reflects possible total hazards. Several TACs have effects on the respiratory system including acetaldehyde, acrolein, formaldehyde, xylenes, and diesel particulates. Non-cancer hazards calculated for the Bradley West Project were calculated for the respiratory system which accounted for essentially all potential non-cancer hazards.

3. TAC EMISSIONS AND DISPERSION

3.1 TAC Emissions

Both organic and particulate-bound TACs are analyzed in this HHRA. TACs are constituents of either VOC or PM10. Emissions of organic and particulate-bound TACs were developed from VOC and PM10 emission inventories for the same sources analyzed in Section 4.4 of the Bradley West Project Draft EIR. Speciation profiles[18] for VOC and PM10 emissions from individual source types, primarily developed by CARB, were used to calculate TAC emissions.[19,20] TAC emissions from both construction and Bradley West Project-specific operational activities were included.

3.1.1 Construction Sources

On-airport construction sources of TAC emissions include: (1) off-road heavy duty construction equipment; (2) on-road equipment and vehicles; (3) generators; and (4) and construction material (e.g., VOCs from striping and asphalt paving). The construction schedule combined with the VOC and PM10 pollutant emissions inventory prepared for the Bradley West Project were the basis for development of the TAC emissions inventory. The methodology for estimating Bradley West Project construction VOC and PM10 emissions are presented in Section 4.4, *Air Quality*, and calculation results are provided in Appendix E of the Bradley West Project Draft EIR. A summary of construction VOC and PM10 emissions are included in Attachment 1 of this appendix. Short-term exposure was evaluated using the daily emissions during the peak month of Bradley West Project construction. Long-term exposure was evaluated using period-average daily emissions in the peak year of construction to quantify chronic health impacts.

Note that construction-related commitments and mitigation measures for the LAX Master Plan applicable to the Bradley West Project were considered in the emissions inventory as part of the project. Specific construction-related mitigation measures associated with LAX Master Plan Mitigation Measure MM-AQ-2 that were assumed to be in place during construction are shown in Table 4.4-7 of the Bradley West Project Draft EIR. In addition, LAWA will comply with SCAQMD Rule 403 for fugitive dust control, and with the Community Benefits Agreement (CBA), Section X.F.1 for control of diesel particulate matter from construction equipment. The emission reductions associated with these controls are shown in Table 4.4-6 of the Bradley West Project Draft EIR.

For the analysis included in Section 4.4, *Air Quality*, of the Bradley West Project Draft EIR, emissions from construction equipment engines and dust from construction activities, without application of CBA Section X.F.1 or Rule 403 requirements are presented as "uncontrolled" emissions. These uncontrolled emissions form the basis of the "unmitigated" risk characterization developed in this appendix. The controlled emissions in Section 4.4, *Air Quality*, estimated from installation of diesel particulate filters and application of dust control methods, form the basis of the "mitigated" risks described herein.

Mitigation measures are focused on PM10 emissions from diesel construction equipment because the program-level HHRA and subsequent project-level risk assessments have all identified diesel particulate matter as the most important contributor to total cancer risks. Particulate filters can reduce PM10 emissions by up to 60 percent; however not all equipment can be fitted with these filters and not all filters will achieve this level of emissions reduction. Thus, mitigation is based on an evaluation of the likely mix

---

18 Speciation profiles provide estimates of the chemical composition of emissions, and are used in the emission inventory and air quality models. CARB maintains and updates estimates of the chemical composition and size fractions of PM10 and the chemical composition and reactive fractions of ROG, for a variety of emission source categories. Speciation profiles are used to provide estimates of TAC emissions.

20 California Air Resources Board, Draft California Emission Inventory Development and Reporting System - Organic Gas Speciation Profiles, 2003, Available: http://www.arb.ca.gov/ei/speciate/ORGPROF_03_19_03.xls.

of construction equipment and predictions of the overall percent reduction in PM10 release. This evaluation is described in more detail in Section 4.4, *Air Quality*, of the Bradley West Project Draft EIR.

Reduction in PM10 emissions from construction equipment affects release of diesel particulates and chromium VI, which are associated mainly with diesel exhaust, at least for the Bradley West Project. Diesel filters are predicted to have little effect on total release of vanadium, another important contributor to cancer risk and to non-cancer hazard. Vanadium emissions are mainly associated with fugitive dust, and reduction in vanadium emissions is achieved mainly through dust suppression measures. Thus, under mitigation, percent reductions of emissions of diesel particulates and chromium VI on the one hand and vanadium on the other will not be the same.

3.1.2 Operational Sources

Although the cumulative effect on airport operational TAC emissions of the Bradley West Project, together with the effects of all LAX Master Plan projects, was addressed in the LAX Master Plan Final EIR, emission estimates were not prepared for Bradley West Project-specific operational sources in the LAX Master Plan Final EIR. Bradley West Project-specific operational sources are those sources that would have different operating characteristics after completion of the Bradley West Project than after full implementation of the LAX Master Plan. These sources include operational emissions associated with aircraft activity on the ground at LAX, with transporting passengers between TBIT and the gates at the West Remote Pads, and with TBIT heating and cooling units. Descriptions of the operational sources are provided in Section 4.4.2.2 of the Bradley West Project Draft EIR. These emissions were analyzed for 2013 with and without the project as well as for 2008 baseline conditions in order to determine the incremental impact. Evaluation of potential impacts to human health associated with these Bradley West Project-specific operational sources (e.g., passenger busing, utility increases to meet demands, and aircraft operations) were assessed in this HHRA. On-airport operational sources of TAC emissions would include: (1) buses transporting passengers between the TBIT concourses and the remote West Gates; (2) Bradley West Project utilities, and (3) Bradley West Project-specific aircraft in the taxi/idle mode.

3.2 Exposure Concentrations (Dispersion)

Dispersion modeling analysis of TACs was conducted for construction sources and for Bradley West Project-specific operational sources. The USEPA AERMOD[21] dispersion model was used to conduct this analysis. For the TAC analysis, VOC and PM concentrations were modeled using AERMOD, then resulting concentrations were speciated into individual organic or particulate TAC concentrations. For example, if the VOC concentration at a particular grid node was 0.1 ug/m^3 and a particular organic chemical made up 1 percent of VOC, the concentration of that chemical would be 0.001 ug/m^3.

Receptor[22] locations (i.e., grid nodes) included in the modeling analysis were located at the airport fence-line, along a line set back approximately 25 meters outside the property boundary, and also in nearby residential communities along the prevailing wind direction to the east and northeast of LAX. Concentrations at the fence-line locations represent maximum concentrations of TACs predicted by the air dispersion modeling, can be used to evaluate exposure to a MEI, and thus provide a ceiling for risks and hazards for off-airport residential, commercial, and student receptors. Although the fence-line is the closest location with unrestricted access to Bradley West Project construction emission sources, actual receptors would not be working or residing at these fence-line locations. Thus, the grid nodes set back approximately 25 meters from the property boundary were evaluated to represent locations of residences, commercial establishments, and schools. Seventeen of the grid node locations that are located closest to the three schools nearest LAX (i.e., St. Bernard High School, Visitation Elementary School, and Imperial Avenue School) were selected to assess acute non-cancer health hazards for sensitive receptors

---

21 U.S. Environmental Protection Agency, User's Guide for the AMS/EPA Regulatory Model - AERMOD, EPA-454/B-03-001, September 2004.

22 Receptors represent locations in the vicinity of the airport where people could potentially be exposed to the TACs by breathing the air.

attending or working at schools near the fence-line. The analysis for these seventeen grid nodes provides direct information on potential impacts on students, faculty and staff at these schools. To ensure a conservative analysis for school children, grid nodes were placed between the schools and construction and operational sources and somewhat closer to these TAC sources. Finally, six locations on the airport were evaluated to represent where on-airport workers might receive the greatest exposure to TACs. Risk and hazard estimates for these six additional locations were not used for significance determination; health and safety of on-airport workers is regulated under the California Occupational Safety and Health Administration (CalOSHA) and no risk or hazards are estimated for these workers. Instead, these estimates are used to provide additional perspective on possible impacts of construction emissions by comparison to the CalOSHA 8-hour Time-Weighted Average Permissible Exposure Levels (PEL-TWAs).[23] AERMOD input files are presented in Attachment 2.

The analysis was used to determine the contribution that Bradley West Project would make to airport-related risks and hazards. The following sections provide a brief summary of the modeling approach used for construction and operational sources.

3.2.1 Construction Activity Dispersion Analysis

The AERMOD model was used to calculate annual average (chronic and carcinogenic exposure) and peak hour (acute exposure) chemical concentrations associated with each emitting source. The model requires various input parameters including chemical emission data and local meteorology. Inputs for each emitting source were based on characterizations of each pollutant. Exhaust emissions from construction equipment were treated as a set of elevated polygon area sources. The dimensions of the area sources reflect the active construction zone. The release height was assumed to be 5 meters which represents the mid-range of the expected plume rise from frequently used construction equipment during daytime atmospheric conditions. Construction materials (e.g., asphalt paving operations and coating and architectural coating) were treated as a set of ground-release volume sources with the number and dimensions of the volume sources reflecting the active construction zone.

3.2.2 Operational Source Dispersion Analysis

As with the construction sources noted above, the AERMOD model was used to calculate annual average (chronic and carcinogenic exposure) and peak hour (acute exposure) chemical concentrations associated with each emitting source. Passenger buses were treated as a line source (which are incorporated into AERMOD as a series of volume sources) between TBIT and the remote West Gates. Bradley West Project boilers and cooling tower are treated as two point sources (one for boilers and one for the cooling tower) located on top of the TBIT core building. Aircraft are treated as a single volume source that covers all of the paved area at LAX where aircraft can be located (runways, taxiways, and passenger aircraft ramps/aprons). Consistent with EDMS 5.1, the aircraft emission source is located 12 meters above the ground to address engine exhaust plume rise.

4. HUMAN HEALTH RISK ASSESSMENT

This HHRA addresses potential impacts to human health associated with releases of TACs that are anticipated to occur during construction and subsequent operation of the Bradley West Project. Cancer and chronic non-cancer risk estimates for impacts of the Bradley West Project are based on estimated project emissions and air dispersion modeling as discussed above and are discussed in the following sections. Acute non-cancer hazard estimates for construction and operational sources were also addressed using emission estimates and dispersion modeling. Risk estimates for construction and operational sources, presented in Attachments 3 and 4 to this appendix, indicate that estimates of health risks associated with emissions during and subsequent to the Bradley West Project would be below regulatory thresholds of significance. Since assessment of health risks included locations where concentrations of TACs were predicted to be highest, either on-airport for construction workers or at locations in the immediate vicinity of the airport for other receptors, this finding applies to all areas on and around LAX.

Cumulative risks were evaluated previously in the LAX Master Plan Final EIR; methods used to evaluate these risks have not changed. Methods used to evaluate cumulative non-cancer hazards are discussed in the LAX Master Plan Final EIR, Technical Report 9a.

4.1 Exposure Assessment

For the Bradley West Project, four receptors (human subpopulations) were selected for quantitative evaluation: workers (on-airport and off-airport), off-airport adult residents, off-airport child residents and off-airport school children. Each receptor represents a unique population and set of exposure conditions. As a whole, they cover a range of exposure scenarios for the potentially most affected human receptors within the study area. Receptors for which exposure scenarios are prepared were selected to provide the most conservative, and therefore, protective, values for health impact assessment. By protecting the most exposed individuals, the general population is also protected.

Exposure scenarios include receptors and the various pathways by which they might be exposed to TACs of concern. A complete exposure pathway consists of four parts:

- A TAC source (e.g., construction equipment fuel combustion)
- A release mechanism (e.g., construction equipment engine exhaust)
- A means of transport from point of release to point of exposure (e.g., local winds)
- A route of exposure (e.g., inhalation)

If any of these elements of an exposure pathway is absent, no exposure can take place and the pathway is considered incomplete and is not evaluated. Numerous potentially complete exposure pathways exist for receptors at or near LAX. For this HHRA, the inhalation pathway is the most important complete exposure pathway and is quantitatively evaluated for all receptors. Other exposure pathways that may be complete (e.g., incidental ingestion of windblown TACs deposited in off-airport soil) were evaluated in the program-level HHRA prepared for the LAX Master Plan and are discussed in the Uncertainties Section of this appendix.

4.1.1 Calculation of Chronic Daily Intakes (CDI)

To estimate potential cancer risks and the potential for adverse non-cancer health hazards, TAC intakes for each pathway for each receptor must be estimated. For cancer and chronic non-cancer risk assessment, average long-term daily intakes are used to estimate risk and hazards. Chronic daily intake (CDI) for TACs is estimated as follows:[24]

CDI = (C x IR x EF x ED) / (BW AT)

Where:
- CDI = chronic daily intake (mg/kg body weight/day)
- C = chemical concentration in exposure medium (µg/m^3)
- IR = inhalation rate (m^3/day)
- EF = exposure frequency and duration (days/year)
- ED = exposure duration (years)
- BW = body weight (kg)
- AT = average time; e.g., the period over which exposure is averaged (days)

Averaging time for estimation of cancer risk is 70 years or 25,550 days. Cancer risk is evaluated as the lifetime average daily dose (LADD) according to CalEPA and USEPA guidance. Averaging time for estimation of non-cancer hazards is the duration of exposure, expressed in days. Non-cancer hazards are evaluated as average daily dose (ADD) over the period of exposure, again, following CalEPA and USEPA guidance.

Exposure parameters used to calculate LADD and ADD for each of these pathways are summarized in **Table 2,** Parameters Used to Estimate Exposures to TACs of Concern. Exposure parameters are based on the CalEPA Supplemental Guidance for Human Health Multimedia Risk Assessments of Hazardous Waste Sites and Permitted Facilities,[25] USEPA Exposure Factors Handbook,[26] and CalEPA Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments.[27] These exposure parameters were selected to maintain consistency with the health risk analyses conducted for the LAX Master Plan Final EIR[28], the SAIP EIR[29], and the CFTP Draft EIR[30]. However, the CalEPA Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments recommends a range of exposure durations and inhalation rates be evaluated. Additional analyses presented below in Section 5, *Uncertainties*, verify that the sensitivity of the analyses to these variations in exposure durations and inhalation rates does not change the conclusions regarding potential impacts of the project.

4.2 Cancer Risks and Non-Cancer Hazards Associated with Bradley West Project Construction

Risk estimates for construction and operational sources are presented below for on-airport workers (occupational exposure), and off-airport workers, residents, and school children. Acute and chronic non-cancer risks are discussed.

4.2.1 Comparison of On-Airport Air Concentrations with OSHA Limits for Construction Workers

Effects on construction workers were evaluated by comparing estimated maximum 1-hour air concentrations of TACs for the Bradley West Project to the California Occupational Safety and Health Administration (CalOSHA) 8-hour Time-Weighted Average Permissible Exposure Levels (PEL-TWAs).[31] For pollutants with no PELs, Threshold Limit Values (TLVs) established by the American Conference of Governmental Industrial Hygienists (ACGIH)[32] were used. Estimated on-airport air concentrations and PEL-TWAs for TACs of concern for LAX are presented in **Table 3**.

1. All TACs for which PEL-TWAs are available are listed. PEL-TWAs are not available for diesel exhaust, propylene, zinc, and sulfates.
2. Maximum 1-hour concentrations at on-airport location. (W2 for VOCs and W3 for inorganics, except for ammonium ion, sulfates and diesel PM, which is W2)
3. Values listed are 1-hour concentrations in the CTA which represent reasonable estimates of 8-hour concentrations in the Bradley West Project construction area
4. California Occupational Safety and Health Administration. Permissible Exposure Limits for Chemical Contaminants, Table AC-1, 2008, http://www.dir.ca.gov/title8/5155table_ac1.html.
5. CalOSHA does not have a value; value is from American Conference of Governmental Industrial Hygienists (ACGIH), Documentation of the Threshold Limit Values and Biological Exposure Indices, 8th ed., Cincinnati, Ohio, 1998.
6. NE = Not Estimated
7. NA = Not Available
8. Value listed for vanadium is for vanadium pentoxide, the most common form of vanadium

Source: CDM, 2009.

Estimated maximum 1-hour air concentrations at on-airport locations under the Bradley West Project for both unmitigated and mitigated construction and operational scenarios are a few to several orders of magnitude below PELs or TLVs for all TACs. This result suggests that air concentrations from airport emissions with or without implementation of the Bradley West Project would not exceed those considered "acceptable" by CalOSHA standards.

4.2.2 Cancer Risks and Chronic Non-Cancer Hazards for Maximally Exposed Individuals (MEI) -- Residents and School Children

For the Bradley West Project, approximately 451 grid points were analyzed along the airport fence-line and in the vicinity of the airport. Concentrations at the fence-line locations represent maximum concentrations of TACs predicted by the air dispersion modeling, can be used to evaluate exposure to a MEI, and thus provide a ceiling for risks and hazards for off-airport residential, commercial, and student receptors. In essence, these calculations assumed that people live, work, and go to school at the LAX fence-line. Although this assumption is incorrect, it is obviously conservative. No exposures or risks within the community would be higher than those calculated in this HHRA.

Air concentrations for TACs for construction and operational sources were developed using emissions estimates and dispersion modeling as described in Sections 3.1 and 3.2 above. Using these emission estimates, exposure parameters for potential receptors and current toxicity values, cancer risks and chronic non-cancer health hazards were calculated for adult residents (adult+child), resident children ages 0 to 6 years, and for elementary-aged school children at fence-line locations where air concentrations for TACs were predicted. Cancer risks and chronic non-cancer human health hazards for MEI at the fence-line location with maximum cancer risks are summarized in **Table 4**; calculations are presented in Attachment 3.

Table 4

Cancer Risks and Chronic Non-Cancer Human Health Hazards for Maximally Exposed Individuals for Bradley West Project

	Unmitigated		Mitigated	
Receptor Type	**Constr.**	**Oper.[3]**	**Constr.**	**Oper.[3]**
Cancer Risks[1,2] (per million people)				
Child Resident	1.3	0.43	1.2	0.43
School Child	0.11	0.037	0.10	0.037
Adult + Child Resident[4]	5.1	1.7	4.9	1.7
Adult Resident	4.2	1.4	4.0	1.4
Adult Worker	3.6	0.55	3.3	0.55
Non-Cancer Chronic Hazards[2,5]				
Child Resident	0.03	0.09	0.02	0.09
School Child	0.003	0.008	0.002	0.008
Adult Resident	0.009	0.03	0.006	0.03
Adult Worker	0.02	0.02	0.01	0.02

1 Values provided are changes in the number of cancer cases per million people exposed as compared to baseline conditions. Cancer estimates are rounded to two significant figures to show difference between mitigated and unmitigated.
2 Note maximum concentrations for each scenario are not at the same location (grid point).
3 Unmitigated and mitigated estimates for operations are assumed to be the same. Because mitigation measures only address PM10 emissions, projected air emissions for Bradley West Project-specific operations after mitigation were not modeled since the unmitigated risks and hazards for this scenario are below the levels of significance and primarily attributable to VOCs, which would not be affected by the proposed mitigation measures.
4 Includes exposure to TACs released from LAX from childhood (ages 0-6) through adulthood (ages 7-70).
5 Hazard indices are totals for all TACs that may affect the respiratory system. This hazard index is essentially equal to the total for all TACs.

Source: CDM, 2009.

4.2.2.1 Residents (Adults and Young Children)

Estimated cancer risk for adult residents and child residents for the unmitigated Bradley West Project construction were 4 in one million and 1 in one million, respectively. Estimated cancer risks are higher for adults than for children, because exposure duration for adults is longer. Estimated cancer risks from construction sources for a young child through adulthood (adult + child) at the modeled location with maximum construction cancer risks was 5 in one million. Exposure to diesel particulate matter released during construction contributed about 82 percent of cancer risks for adults and children. The remaining portion of the risk from construction sources is attributable to hexavalent chromium (12 percent) and vanadium (4 percent).

Operation emissions of the unmitigated Bradley West Project would result in a MEI cancer risk of 1 in one million for adult residents and 0.4 in one million for child residents at the residential location with the maximum operation cancer risk. Estimated cancer risks for a young child through adulthood (adult + child) at the modeled location with maximum operation cancer risks was 2 in one million. Cancer risks for adults and children under the Bradley West Project operations are due primarily to exposure to 1,3-butadiene, which contributes about 59 percent of the risk estimate from operational sources, with the remaining portion of the operational source risk attributable to formaldehyde (15 percent) and benzene and diesel particulate matter (10 percent each). Overall, construction sources are associated with higher cancer risks than operational sources.

These updated estimates show that project-related cancer risks for adults and for young children are predicted to be below the threshold of significance of 10 in one million for the Bradley West Project. These estimates are likely to greatly overestimate actual exposure because they assume exposure occurs at the LAX fence-line for a lifetime. Concentrations at the fence-line are maxima. Actual exposures will occur at locations removed from the fence-line where lower concentrations are predicted. Further, although the exposure period for receptors to Bradley West Project-specific operational sources is not a defined period of time, the construction period of the Bradley West Project is estimated to be about five years. Only during this time period would exposure to construction emissions actually occur. This issue is discussed in more detail below in Section 5, *Uncertainties*.

Although the construction and operation periods of the Bradley West Project would overlap for up to approximately two years (2013 and 2014), combining cancer risks estimates from these two phases is not reasonable, since it would assume that both construction of the Bradley West Project and post-construction operational changes would co-occur for 70 years. As mentioned above, construction of the Bradley West Project would require only approximately 5 years. Cancer risk estimates evaluating concurrent Bradley West Project construction and operation for 70 years is discussed in Section 5, *Uncertainties,* of this appendix.

Project-related chronic non-cancer hazard indices for construction impacts associated with the Bradley West Project are also provided in **Table 4**. Hazard indices for adult residents and child residents living at the peak TAC concentration location under the unmitigated scenario for the Bradley West Project construction are estimated to be 0.009 and 0.03, respectively. All hazard estimates for the Bradley West Project are below the significance threshold of 1. Note that these estimates do not take mitigation measures into effect. Any additional mitigation of construction emissions would reduce these hazard estimates.

Hazard index estimates are higher for children than adults, because they are normalized to body weight, which is lower for children than for adults. Diesel particulate matter contributes 23 percent or more to the hazard index from construction sources for all residential receptors, but other TAC also make important contributions, vanadium (34 percent), chlorine (18 percent), formaldehyde (6 percent), and manganese (10 percent). The source of diesel particulate matter is mainly construction equipment. Vanadium emissions are primarily from fugitive dust. Project-related chronic non-cancer health hazards for adults and for young children are predicted to be below the threshold of significance.

Hazard indices for adult residents and child residents living at the peak TAC concentration location under the unmitigated scenario for Bradley West Project-specific operations are estimated to be 0.03 and 0.09, respectively. Overall, operational sources contribute more to chronic hazards than construction sources, with exposure to acrolein contributing 58 percent, followed by formaldehyde contributing 13 percent, vanadium contributing 10 percent, diesel particulate matter contributing 7 percent, and chlorine contributing 5 percent. The acrolein in aircraft emissions contributes 81 percent to the hazard index from operational sources for all residential receptors and formaldehyde contributes 16 percent.

Risks and hazards for the Bradley West Project construction are slightly lower when anticipated mitigation measures are considered. As discussed above, these mitigation measures address PM10 emissions from diesel construction equipment because exposure to diesel particulate matter is responsible for most cancer risk from construction sources. Hazard estimates for all chemicals are below thresholds of significance and mitigation measures to reduce these hazards are not required. However, since diesel emissions are also significant contributors to non-cancer hazards, mitigation measures directed at PM10 will also add to the margin of safety between hazard estimates and the threshold of significance. VOC (vapor-phase) emissions are not anticipated to be reduced substantially by planned mitigation measures and risks and hazards due to exposure to VOC remain the same after mitigation. Because mitigation measures only address PM10 emissions, projected air emissions for Bradley West Project-specific operations after mitigation were not modeled. Unmitigated risks and hazards for this scenario are below levels of significance and are primarily attributable to VOCs, which would not be affected by the proposed mitigation measures.

Estimated cancer risk for adult residents and child residents for the mitigated Bradley West Project construction were 4 in one million and 1 in one million, respectively. Estimated cancer risks for a young child through adulthood (adult + child) at the fence-line location where maximum TAC concentrations were estimated was 5 in one million. Cancer risks under Bradley West Project after mitigation due to construction impacts are still primarily due to predicted exposure to diesel particulate matter contributing -- about 90 percent of the risk estimate. Cancer risks are typically rounded to one significant figure. Thus, although total risks are reduced somewhat when mitigation is considered, these risk estimates would remain the same after rounding.

Hazard indices for Bradley West Project construction for adult residents and child residents living at the fence-line location where maximum TAC concentrations were estimate after mitigation are estimated to be 0.006 and 0.02, respectively. After mitigation, the contribution of the constituents changes slightly: diesel particulate matter contributes 38 percent, vanadium contributes 24 percent, chlorine contributes 16 percent, formaldehyde contributes 8 percent, and manganese contributes 7 percent. Note that the relative percent contributions from diesel particulate matter and vanadium change when mitigation is considered. As explained above in Section 3.1.1, *Construction Sources*, reduction in diesel particulate matter emissions are accomplished using filters on construction equipment while reduction vanadium emissions is accomplished primarily via control of fugitive dust. Since control is not anticipated to achieve the same percent reduction for filters and dust control, resulting estimates for reduction in diesel PM and vanadium emissions are not equal.

4.2.2.2 School Children

Cancer risks for children attending schools within the study area are estimated to be 0.1 in one million for the unmitigated Bradley West Project construction scenario and 0.04 in one million for the unmitigated Bradley West Project-specific operations scenario. Risks below 1 in one million and less are typically considered negligible by regulatory agencies in California. For the Bradley West Project construction scenario, diesel particulate matter contributed to the majority (82 percent) of the cancer risk. 1,3-butadiene contributed to the majority (59 percent) of the cancer risk for the Bradley West Project-specific operations scenario with the remaining portion of the risk attributable to formaldehyde (15 percent), benzene (10 percent) and diesel particulate matter (10 percent). Project-related cancer risks for school children are predicted to be below the threshold of significance for both Bradley West Project construction and Bradley West Project-specific operations.

HIs for chemicals affecting the same target (i.e., the respiratory system) for MEI school children are 0.003 for construction impacts under unmitigated conditions and 0.008 for Bradley West Project-specific operations impacts. Estimated HIs for Bradley West Project construction are 23 percent due to exposure to diesel particulates from construction equipment operations with the remaining portion of the total hazard index attributable to vanadium (34 percent), chlorine (18 percent), formaldehyde (6 percent), and manganese (10 percent). Estimated HIs for Bradley West Project-specific operations are 81 percent due to exposure to acrolein (81 percent) and formaldehyde (16 percent), primarily from aircraft taxi and idling. Project-related chronic non-cancer health hazards for school children are predicted to be below the threshold of significance for both Bradley West Project construction and Bradley West Project-specific operations.

Risks and hazards are slightly lower for Bradley West Project construction when mitigation is considered. Cancer risks for children attending schools within the study area under the mitigated scenario are estimated to be 0.1 in one million. Again, risk estimates are actually somewhat lower but round to the same single significant figure. HIs for MEI school children are 0.002 after mitigation. As noted in the previous section, Bradley West Project-specific operations were not evaluated under mitigated conditions because risks and hazards for this scenario are primarily attributable to VOCs, which would not be affected by mitigation measures.

4.2.2.3 Adult Workers

Cancer risks were evaluated for adult workers at grid locations identified as commercial in land use within the study area. Cancer risks for adult workers under the unmitigated scenario are estimated to be 4 in one million for construction impacts and 1 in one million for Bradley West Project-specific operations impacts, which is below the threshold of significance of 10 in one million. For construction impacts, diesel particulate matter contributed to the majority (76 percent) of the cancer risk with the remaining portion of the risk attributable to hexavalent chromium (15 percent) and vanadium (7 percent). 1,3-butadiene contributed to the majority (64 percent) of the cancer risk for the Bradley West Project-specific operations scenario with the remaining portion of the risk attributable to formaldehyde (16 percent), benzene (11 percent) and naphthalene (4 percent).

HIs for adult workers are 0.02 for both construction and Bradley West Project-specific operations impacts under unmitigated conditions. Estimated HIs for construction impacts are 17 percent due to exposure to diesel particulates from construction equipment operations with the remaining portion of the total hazard index attributable to vanadium (41 percent), chlorine (21 percent), formaldehyde (4 percent), and manganese (11 percent). For the Bradley West Project-specific operations scenario, contributions are different: acrolein contributed to the majority (82 percent) of risk with the remaining portion of the risk attributable to formaldehyde (16 percent). Project-related chronic non-cancer health hazards for adult workers are predicted to be below the threshold of significance.

After mitigation for Bradley West Project construction, risks and hazards are slightly lower, but most risks round to the same single significant figure. Cancer risks for adult workers within the study area are 3 in one million, and HIs for adult workers are 0.01.

4.2.2.4 Risks Described Geographically

Total cancer risks for construction of the Bradley West Project were calculated for each grid node in the AERMOD modeling domain. Risks were then used to generate estimates of risks on a spatial basis as overlays on a map of the LAX study area. Cancer risks under pre-mitigation conditions are presented in **Figure 1** for Bradley West Project construction and **Figure 2** for Bradley West Project-specific operations. Cancer risks under post-mitigation conditions are presented in **Figure 3**. These figures depict ranges of cancer risks from less than 1 in one million to 10 in one million as an increase in cancer risk compared to the 2008 baseline. Since none of the cancer risks for the Bradley West Project exceeded the significance threshold of 10 in one million, no grid nodes were identified as having risks in the greater than 10 in one million range. Grid nodes in the figures are represented by shapes reflecting their land use type (residential, commercial, or school), which is also the basis by which the risks at that location were calculated. Cancer risks for the adult + child resident were used to represent the residential and school nodes because these values provide a ceiling for the risks at these locations.

As shown on these figures, the distribution of cancer risks is much the same between the unmitigated and mitigated conditions for Bradley West Project construction with only a few grid nodes changing color from the 1 to 5 in one million range to the less than 1 in one million range. The peak cancer risk location is also reduced from the 5 to 10 in one million range to the 1 to 5 in one million range. At first glance, cancer risks appear to be higher on the west side of LAX than on the east side; however, this difference may be more a reflection of the receptor type (residential receptors on the west side compared to the commercial receptors on the east side) than TAC concentrations. In fact, commercial grid nodes nearest the LAX Theme building (CTA)where cancer risks higher than commercial grid node locations to the southeast, and residential nodes to the northeast of LAX where cancer risks are also relatively high suggest that risks are generally higher along the path of the prevailing wind. This finding corresponds to the LAX Master Plan EIR geographical findings regarding operational cancer risks.

To provide a more focused comparison of spatial differences, cancer risks at fence-line grid nodes were compared to the cancer risks of the grid nodes 25 meters further out from this LAX boundary. The results of this comparison for the unmitigated Bradley West Project are summarized in **Table 5**.

Table 5

Comparison of Cancer Risks at Fence-line Receptor Grid Nodes to Cancer Risks at Receptor Grid Nodes 25 Meters Out for the Unmitigated Bradley West Project

Table 5

Comparison of Cancer Risks at Fence-line Receptor Grid Nodes to Cancer Risks at Receptor Grid Nodes 25 Meters Out for the Unmitigated Bradley West Project

Fence-line Receptor Grid Node	Corresponding Receptor Grid Node 25 Meters Out	Percentage of Cancer Risk Decrease from Fenceline[1]	
		Construction	Operation
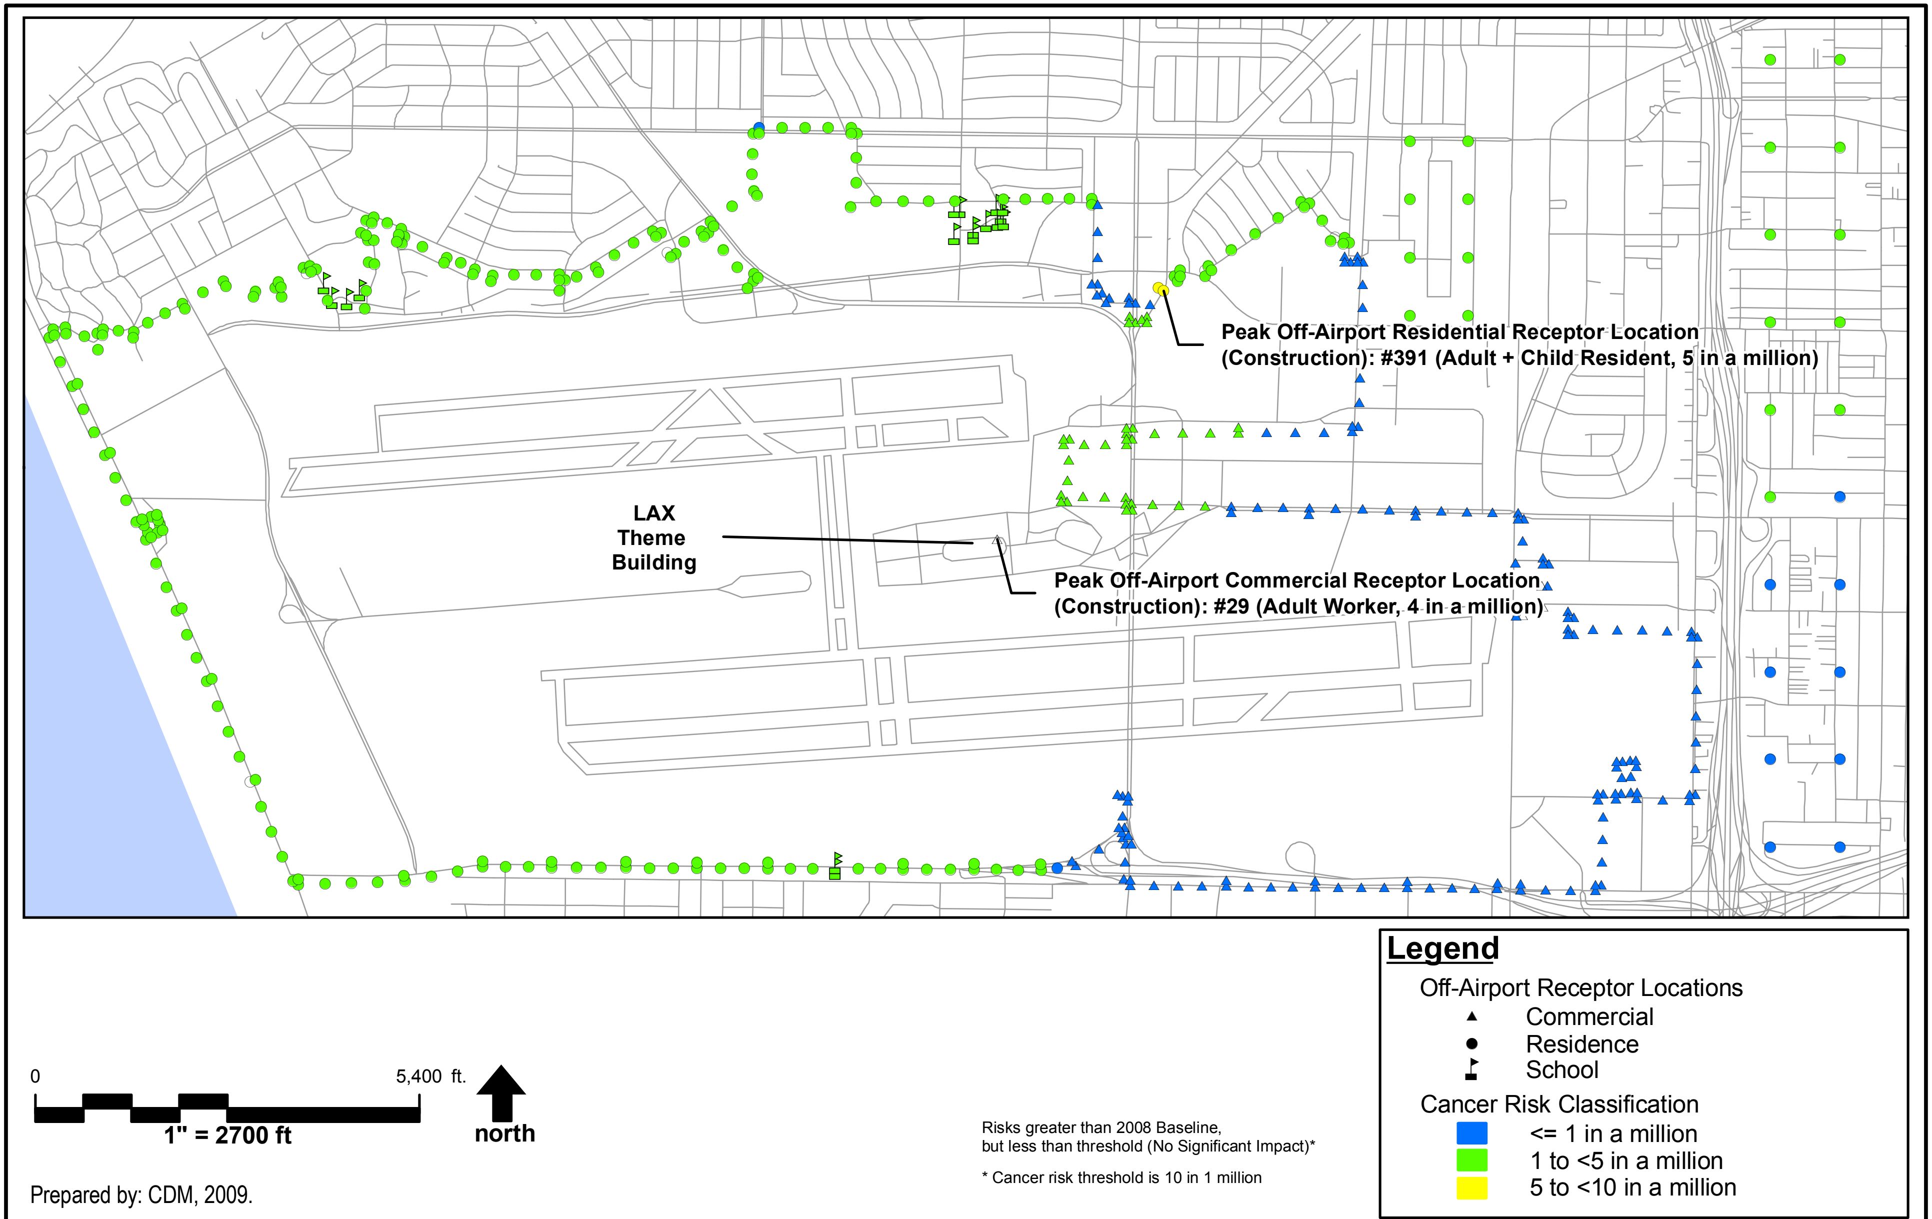
441	294	2.8%	4.7%
442	296	2.4%	5.1%
443	299	2.6%	5.2%
444	302	3.4%	5.5%
445	305	4.2%	5.8%
446	308	4.6%	6.5%
447	311	4.5%	6.3%
448	314	4.1%	5.4%
449	317	3.7%	3.6%
450	320	3.8%	2.9%
451	323	3.8%	2.2%

1 A negative decrease in percentage (shown in **bold**) indicates that the cancer risk increased from the fence-line to the grid node 25 meters out.

Source: CDM, 2009.

For the majority of the grid nodes, TAC concentrations and therefore corresponding cancer risks decreased (by up to 15 percent), the further out the node was from LAX. In a few instances, cancer risks increased slightly (less than 3 percent). These locations are highlighted in **Figure 4**. Such small changes are expected for closely spaced grid nodes and suggest that small local differences in concentrations are not an important uncertainty in the assessment. This conclusion is supported by results from evaluation at grid nodes further into the community east and north east of LAX. Prevailing winds are from the west and southwest indicating that chronic impacts in these communities would be among the highest expected outside of the LAX boundary. Even so, risk estimates at these locations are uniformly low.

Since all non-cancer health effects for the Bradley West Project are more than an order of magnitude less than 1, a figure depicting the geographic extent of non-cancer health hazards would not add to the discussion of these results and was not created.



Risks greater than 2008 Baseline,
but less than threshold (No Significant Impact)*

* Cancer risk threshold is 10 in 1 million

4.2.3 Acute Non-Cancer Hazards

As with chronic cancer risks and non-cancer hazards, acute hazards were analyzed at 451 grid points within the study area. Land use distinctions and different exposure scenarios are irrelevant for assessment of acute risks. For example, someone visiting a commercial establishment would potentially be subject to the same acute risks as someone working at the establishment. However, likely receptors (residential, school, and occupational) for each grid point were designated through inspection of aerial photos, since these designations may provide some reflection of populations more likely to be exposed in certain locations. Residential land use was, for example, assumed for grid points that are adjacent to residential areas. Acute risks at these locations may reflect the relative magnitude of acute risks in residential areas nearest to emission sources. Likewise, off-airport workers were assumed at receptor locations that are adjacent to commercial land uses. Fence-line concentrations of TACs are likely to represent the highest concentrations and potential impacts for residents and workers. Thus, risks and hazards estimated for the LAX fence-line are likely to overestimate risks and hazards that may occur in actual residential or commercial areas. Three schools, St. Bernard High School, Visitation Elementary School, and Imperial Avenue School, were identified as schools in the study area closest to the fence-line; potential acute hazards for school children were estimated at the grid points (seventeen grid points) closest to these locations.

Acrolein is a TAC of concern and is responsible for essentially all predicted chronic non-cancer health hazards associated with LAX operations. This TAC is primarily associated with aircraft emissions. Acrolein is also the only TAC of concern in emissions from LAX that might be present at concentrations approaching a threshold for acute effects. (For a detailed discussion of uncertainties regarding the presence of acrolein in aircraft emissions, see Section 7.3 of Technical Report S-9a of the LAX Master Plan Final EIR.) For the Bradley West Project HHRA, all TACs identified in construction and Bradley West Project-specific operational emissions and for which CalEPA has developed acute RELs are evaluated for potential acute health impacts. For other TACs potential acute health impacts are discussed in the Uncertainties Section below.

Short-term concentrations of TACs for Bradley West Project sources were estimated using AERMOD with the model option for 1-hour maximum concentrations selected. . Acute hazards were estimated at each grid point by comparison of the modeled TAC concentration at each grid point with the acute REL. All acute hazard estimates are specific for airport emissions and are independent of county-wide estimates developed by USEPA.

Hazards due to acute exposure to TACs are all substantially below 1 for selected grid nodes within the study area under both unmitigated and mitigated conditions. The maximum acute hazard associated with construction activities is shown in **Table 6** and is based on potential exposure to formaldehyde. For formaldehyde, if acute effects occurred, they would typically include irritation to the eye and respiratory system and potentially adverse effects to the immune system.[33] The maximum acute hazard associated with Bradley West Project-specific operational activities is based on potential exposure to acrolein. Acute exposures to acrolein may result in mild irritation of eyes and mucous membranes.[34] Because no additional mitigation was assumed for VOC emissions, concentrations of formaldehyde and acrolein for both unmitigated and mitigated conditions are the same.

Acute hazards for TACs other than formaldehyde and acrolein are orders of magnitude below 1 and below the acute hazards estimated for short-term exposure to formaldehyde and acrolein; these results are provided in Attachment 4 to this appendix.

Source: CDM, 2009.

Acute hazard estimates are applicable to all receptors. Toxicity criteria for acute health hazards do not distinguish between adults and children and are the same for all land uses. Acute RELs are established at levels that are considered protective of sensitive populations. A hazard index equal to or greater than 1, the threshold of significance for acute effects, indicates some potential for acute adverse health effects. A hazard index less than 1 suggests that acute adverse health effects are not expected. Project-related acute cancer health hazards for all receptor types do not exceed the threshold of significance for any one hour interval. Calculations for acute health hazards are provided in Attachment 4.

4.3 Cumulative Risks and Non-Cancer Hazards Associated with the Bradley West Project

Unlike air quality, for which standards have been established that determine acceptable levels of pollutant concentrations, no standards exist that establish acceptable levels of human health risks or that identify a threshold of significance for cumulative health risk impacts. Therefore, the discussion below addresses cumulative impacts, and possible project-related contribution to those impacts. No determination is made however regarding the significance of cumulative impacts.

4.3.1 Cumulative Risks and Chronic Non-Cancer Hazards

The SCAQMD conducted an urban air toxics monitoring and evaluation study for the South Coast Air Basin from April 2004 through March 2006 called MATES-III. MATES-III is a follow up to MATES-II and provides an updated general evaluation of cancer risks associated with TACs from all sources within the South Coast Air Basin. According to the study, cancer risks in the Basin range from 870 in one million to 1,400 in one million, with an average of 1,200 in one million. These cancer risk estimates are high and indicate that current impacts associated with sources of TACs from past and present projects in the region are substantial. The MATES-III study is an appropriate estimate of present cumulative impacts of TAC emissions in the South Coast Air Basin. It does not, however, have sufficient resolution to determine the fractional contribution of current LAX operations to TACs in the airshed. Only possible incremental contributions to cumulative impacts can be assessed.

The LAX Master Plan Final EIR used the results of the MATES-II study to address cumulative cancer risks associated with the build alternatives and the No Action/No Project Alternative. Overall, the analyses indicated that:

- LAX operations would have a small impact on cumulative human cancer risks associated with living in the South Coast Air Basin.
- Mitigation would reduce cancer risks below those predicted for pre-mitigation conditions. That is, mitigation would result in a decrease in cumulative risks for many people living closest to the airport.

Although project-specific construction activities of the Bradley West Project were not analyzed in the LAX Master Plan Final EIR, total estimated cancer risks for the Bradley West Project are less than those estimated for the No Action/No Project Alternative in 2005 in the LAX Master Plan Final EIR. Therefore, cumulative impacts for the Bradley West Project would be less than those identified for the No Action/No Project Alternative in 2005 in the LAX Master Plan Final EIR. This conclusion is based on the assumption that impacts associated with the Bradley West Project would be less than construction impacts estimated for the SAIP. The HHRA for the SAIP concluded that the incremental contribution to cancer risk for both operational and construction sources would not be measurable against urban background conditions in the South Coast Air Basin. Based on this conclusion, the Bradley West Project can be expected to result in an extremely small increase in cumulative human cancer risks and the increase would probably not be measurable against urban background conditions in the South Coast Air Basin.

With regard to reasonably foreseeable projects, continued growth and development in the region, as well as other construction projects at LAX, would result in additional sources of TACs. Although future sources and releases of TACs are highly speculative, estimated emissions of other projects at LAX that may be constructed concurrently with the Bradley West Project were assessed to see how they compare to estimated mitigated Bradley West Project emissions. Projects at LAX that were included in this evaluation are: Bradley West Project (Taxiway S and ARFF demolition), Crossfield Taxiway Project, Airfield Operating Area (AOA) Perimeter Fence Enhancements - Phase III, Security Program - In-Line Baggage Screening Systems (T6), TBIT Interior Improvements Program, Airfield Intersection Improvements - Phase 2, Airport Operations Center (AOC)/Emergency Operation Center (EOC), K-9 Training Facility, Central Utilities Plant (CUP) Replacement Program, Passenger Boarding Bridge Replacement, Bus Wash Rack Facility, CTA Elevators and Escalators Replacement, CTA Seismic Retrofits, Sewer Line Replacement, CTA Joint Repair, Roadway Improvements, and Security Barriers, Korean Air Cargo Terminal Improvement Project, West Aircraft Maintenance/Aircraft Parking Area, Westchester Golf Course 3-Hole Expansion Project, Westchester Rainwater (Stormwater) Improvement Project, and Metro Bus Maintenance and Operations Facility. Cumulative incremental cancer risks and hazards from the estimated emissions of these projects at LAX are summarized in **Table 7**. Calculations for cumulative incremental cancer risks and hazards are provided in Attachment 5.

Table 7

Cumulative Incremental Cancer Risks and Chronic Non-Cancer Health Hazards for Maximally Exposed Individuals for Construction of Other Concurrent Projects at LAX Compared to Bradley West Project

Receptor Type	Concurrent Other Projects at LAX Mitigated[2]	Bradley West Project Mitigated[4]	
		Construction	Operation
Incremental Cancer Risks[1] (per million people)			
Child Resident	9	1	0.4
School Child	0.8	0.1	0.04
Adult + Child Resident[5]	38	5	2
Adult Resident	31	4	1
Adult Worker	31	3	0.6
Incremental Non-Cancer Chronic Hazards[4,6]			
Child Resident	0.3	0.02	0.09
School Child	0.03	0.002	0.008
Adult Resident	0.09	0.006	0.03
Adult Worker	0.09	0.01	0.02

1 Values provided are changes in the number of cancer cases per million people exposed as compared to baseline conditions. Cancer and hazard estimates are rounded to one significant figure.

2 Includes Bradley West Project (Taxiway S and ARFF demolition), Crossfield Taxiway Project, Airfield Operating Area (AOA) Perimeter Fence Enhancements - Phase III, Security Program - In-Line Baggage Screening Systems (T6), TBIT Interior Improvements Program, Airfield Intersection Improvements - Phase 2, Airport Operations Center (AOC)/Emergency Operation Center (EOC), K-9 Training Facility, Central Utilities Plant (CUP) Replacement Program, Passenger Boarding Bridge Replacement, Bus Wash Rack Facility, CTA Elevators and Escalators Replacement, CTA Seismic Retrofits, Sewer Line Replacement, CTA Joint Repair, Roadway Improvements, and Security Barriers, Korean Air Cargo Terminal Improvement Project, West Aircraft Maintenance/Aircraft Parking Area, Westchester Golf Course 3-Hole Expansion Project, Westchester Rainwater (Stormwater) Improvement Project, and Metro Bus Maintenance and Operations Facility.

3 Concurrent Other Projects at LAX Mitigated includes both Bradley West Project construction and operation even though construction of Bradley West Project and operation of Bradley West Project will only overlap a couple of years. The uncertainty arising from combining the risks and hazards from these two phases is further discussed in the uncertainties section (Section 5) of this appendix.

4 Values shown are unmitigated risks and hazards for Bradley West Project-specific operations. Because mitigation measures only address PM10 emissions, projected air emissions for Bradley West Project-specific operations after mitigation were not modeled since the unmitigated risks and hazards for this scenario are below the levels of significance and primarily attributable to VOCs, which would not be affected by the proposed mitigation measures.

5 Includes exposure to TACs released from LAX from childhood (ages 0-6) through adulthood (ages 7-70).

6 Hazard indices are totals for all TACs that may affect the respiratory system. This incremental hazard index is essentially equal to the total for all TACs.

Source: CDM, 2009.

As shown in **Table 7**, cancer risks and hazards from the mitigated Bradley West Project construction comprise approximately 14 to 27 percent of cancer risks and 7 to 17 percent of the hazards from the combined other projects at LAX anticipated to be under construction concurrent with the Bradley West Project. Thus, risks and hazards associated with Bradley West Project construction after mitigation combined with the risks and hazards of other concurrent projects at LAX would result in a small increase in cumulative human cancer risks and health hazards. This increment would still not be measurable against urban background conditions in the South Coast Air Basin. Risks and hazards associated with Bradley West Project-specific operations would have an even smaller impact on cumulative human cancer risks and health hazards against urban background conditions in the South Coast Air Basin.

Meaningful quantification of future cumulative health risk exposure in the entire South Coast Air Basin is not possible. Moreover, the threshold of significance used in this analysis is based on incremental cancer risk increase of individual projects; this threshold is not appropriately applied to conclusions regarding the cumulative cancer risk in the Basin. However, based on the relatively high cancer risk level associated with past and present projects in the Basin, as represented by the environmental baseline (i.e., an additional 1,200 cancer cases per million), the Bradley West Project would not add incrementally to the already high cumulative impacts in the South Coast Air Basin near LAX.

The above comparisons do not account for possible positive changes in air quality in the South Coast Air Basin in the future. SCAQMD and other agencies are consistently working to reduce air pollution. In particular, reductions in emission of diesel particulates are being considered for the near future. Since diesel particulate matter is the major contributor to estimated cancer risks, substantial reductions in diesel emissions would result in substantial reductions in cumulative cancer risks. These, and other such regulations intended to reduce TAC emissions within the Basin, would reduce cumulative impacts in the region. While continued, if not increased, regulation by the SCAQMD of point sources as well as more stringent emission controls on mobile sources would reduce TAC emissions, whether such measures would alter incremental contributions of TAC releases to cumulative impacts under the Bradley West Project cannot be ascertained.

4.3.2 Cumulative Acute Non-Cancer Hazards

Predicted concentrations of TACs released from construction and operational activities for the Bradley West Project suggest that acute health hazards would not be expected. The assessment of cumulative acute hazards follows the methods used to evaluate cumulative acute hazards presented in the LAX Master Plan Final EIR (Section 4.24.1.7 and Technical Report S-9a, Section 6.3) incorporating updated National-Scale Air Toxics Assessment (NATA)[35] Tables from 1999. When USEPA annual average estimates are converted to possible 1-hour maximum concentrations, acute hazard indices associated with total acrolein concentrations are estimated to range from 2 to 120, with an average of 23, for locations within the study area. Predicted maximum acute hazards associated with acrolein for Bradley West Project construction and operation are 0.0003 and 0.09, respectively. Thus, the Bradley West Project would be expected to contribute substantially less than 1 percent above current levels of acrolein even at locations of maximum impact. Acute hazard indices associated with total formaldehyde concentrations are estimated to range from 0.07 to 1.7, with an average of 0.55, for locations within the study area. Predicted acute hazards associated with formaldehyde for the Bradley West Project are construction and operation 0.07 and 0.02, respectively. Thus, the Bradley West Project would be expected to contribute less than 13 percent above current levels of formaldehyde at residential locations and at commercial off-airport locations.

Similar to cumulative cancer risks, cumulative acute hazards from TACs released from construction activities for other projects at LAX that may be constructed concurrently with the Bradley West Project were assessed and compared to acute hazards for the Bradley West Project construction and Bradley West Project-specific operations. Cumulative acute hazards remain small and substantially less than the threshold of 1, even considering the impacts from several concurrent construction projects. Although acute formaldehyde hazards are much lower for the Bradley West Project than for the cumulative projects, cumulative acute acrolein hazards are in the same range as that for the Bradley West Project alone. This observation reflects modeling of TACs released during construction of other projects at LAX; operational activities from these projects were not included in estimates of cumulative impacts because operations are evaluated in the LAX Master Plan Final EIR.[36] As mentioned previously, acrolein is the TAC of concern that is responsible for essentially all predicted chronic non-cancer health hazards associated with LAX operations. This TAC is primarily associated with aircraft exhaust, although smaller amounts are also found in emissions from internal combustion engines.

5. UNCERTAINTIES

Uncertainties are present in all facets of human health risk assessment. Potential important uncertainties associated with the HHRA for the LAX Master Plan are discussed in detail in Technical Report 14a and Technical Report S-9a of the LAX Master Plan Final EIR. These same uncertainty considerations apply to the analyses presented in the Bradley West Project Draft EIR. These uncertainties are briefly summarized below.

5.1 Uncertainties Associated with Emission Estimates and Dispersion Modeling

Risk estimates were based on chemical concentration estimates obtained through emissions and dispersion modeling. Emissions estimates are sensitive to the values used to represent the numerous emission source variables (e.g., future aircraft operation assumptions) and to the air toxic emission factor values used for each source. Consequently, estimated emissions values are subject to uncertainties. Different assumptions and values of variables would result in different emissions estimates. The HHRA used well-accepted methods and best available emission factor data to develop estimates of emissions, and estimates and assumptions are reasonable and appropriate. Actual emissions are unlikely to be meaningfully greater than those used in the analyses.

5.2 Evaluation of Sensitive Receptor Populations

Certain subpopulations may be more sensitive or susceptible to negative health impacts caused by environmental contaminants than the population at large. Risk estimates presented in the HHRA represent a wide range of potential exposures including the highest that can be reasonably expected. Thus, even though risk estimates are not provided for all potentially sensitive receptors in the area, populations not specifically evaluated are still expected to be represented. For example, quantitatively evaluated populations include those with the highest expected exposure durations and exposure frequencies (e.g., residents). Exposures are therefore expected to be less for other populations, even those with higher chemical sensitivities.

5.3 Uncertainties Associated with Exposure Parameter Assumptions

5.3.1 Uncertainties in Exposure Duration for Cancer Risks

An exposure duration of 70 years was used to estimate possible cancer risks associated with Bradley West Project construction. A 70-year exposure duration is generally used by the SCAQMD in risk assessments performed for permitting purposes. This exposure duration combined with other exposure parameters used in this HHRA assumes that an individual exists who resides where maximum impacts occur in a location near construction similar to construction anticipated for LAX, and that the individual is sedentary, spending essentially all of his/her time at home, and yet still breathes at a rate consistent with relatively high activity. Further, this exposure duration assumes that construction emissions continue for a lifetime (6 years for a child and 70 years for an adult) instead of approximately 5 years as anticipated. In essence, SCAQMD assumes that person would constantly move to locations near construction and always be exposed to construction emissions at the point of greatest impact for their entire lives. This combination of factors never occurs, and any estimates of cancer risk based on such a combination will greatly overestimate possible cancer risks for everyone in the study area. Estimated cancer risks for a 5-year exposure duration presented in **Table 9** show that cancer risks for a 5-year exposure duration are estimated to be at least an order of magnitude lower for the adult resident than that estimated for lifetime exposure. Cancer risk for childhood exposure does not change much when exposure duration is reduced to 5 years. Cancer risks for young children reported in Section 4 are based on an exposure duration of 6 years and assuming a slightly shorter duration makes only a small difference. Usually cancer risk is smaller for young children than for adults due to short childhood exposure duration; however, since exposure duration for all receptors in this uncertainty analysis is approximately 5 years, cancer risk estimates for young children actually slightly higher.

All calculations are provided in Attachment 3.

Table 9

Cancer Risks for Maximally Exposed Individuals for a 5-Year Exposure Duration Consistent with Estimated Construction Time for the Bradley West Project Construction

	Incremental Cancer Risks[1] (per million people)	
Receptor Type	**Unmitigated**	**Mitigated**
Child Resident	1.0	1.0
School Child	0.090	0.086
Adult Resident	0.30	0.29
Adult Worker	0.45	0.42

[1] Values provided are changes in the number of cancer cases per million people exposed as compared to baseline conditions. All estimates are rounded to two significant figures to show small differences between unmitigated and mitigated conditions. Typically risk estimates are rounded to one significant figure to be consistent with uncertainties in these values.

Source: CDM, 2009.

5.3.2 Uncertainties in Inhalation Rates

Inhalation rate for individuals can vary over a range of values for residents, off-airport workers or other receptor groups. These ranges reflect both differences in age and level of activity. Since residents have the longest exposure frequency and duration, and therefore the greatest cancer risks and chronic non-cancer hazards for given ambient air concentrations, they were selected for a sensitivity analysis for inhalation rates. In the Air Toxics Hot Spots Guidance,[37] OEHHA recommends use of a range of inhalation rates for 9-year, 30- year, 70-year exposure durations. OEHHA's suggested rates span a range that includes rates used in the LAX Master Plan Final EIR,[38] the SAIP Final EIR,[39] the CFTP Draft EIR, and the Bradley West Project evaluation presented in Section 4. In addition, the ARB recommends[40] using a breathing rate of 302 L/kg BW day when a single risk value is calculated for risk management decisions. For a limited sensitivity analysis, rates from both OEHHA and ARB guidance were used as input values to calculations for the Bradley West Project construction.

In this analysis, cancer risks and chronic non-cancer hazard quotients were calculated for the above range of inhalation rates at the grid point where the highest impacts were identified for the adult resident for the Bradley West Project construction. Estimated concentrations for unmitigated conditions were used. For a 9-year exposure duration, inhalation rate was varied from 452 L/kg BW-day to 581 L/kg BW-

[38] City of Los Angeles, Final Environmental Impact Report for Los Angeles International Airport (LAX) Proposed Master Plan Improvements, April 2004.

[39] City of Los Angeles, Los Angeles World Airports, Draft Environmental Impact Report for South Airfield Improvement Project, Los Angeles International Airport (LAX), August 2005.

[40] Air Resources Board, Recommended Interim Risk Management Policy for Inhalation-Based Residential Cancer Risk (http://www.arb.ca.gov/toxics/harp/docs/rmpolicy.pdf). October 2003.

day. For 30-year and 70-year exposure durations, inhalation rate was varied from 271 L/kg BW-day to 393 L/kg BW-day. The lower end of the range is an estimate from OEHHA for inhalation rate for average activity levels. The upper end is an estimate from OEHHA for high activity levels. The middle value (302 L/kg BW day) represents the 80th percentile recommended by the ARB. Adult resident inhalation rate used in the Bradley West Project calculation in Section 4 was 20 m^3/day, which is equivalent to 286 L/kg BW-day. Cancer risks and chronic non-cancer hazards for adult residents for these different combinations of exposure durations and inhalation rate are summarized in **Table 10**. These calculations are provided in Attachment 3.

Table 10

Estimated Cancer Risks and Chronic Non-Cancer Hazard Indices for Varying Inhalation Rates for Unmitigated Bradley West Project Construction Scenario

	Presented in Bradley West Project Construction Analysis	Sensitivity Analysis							
	70-year Scenario	9-year Duration		30-year Duration			70-year Duration		
Inhalation Rates (L/kg BW-day)[1]	**286[2]**	**452**	**581**	**271**	**302**	**393**	**271**	**302**	**393**
Off-Airport Adult Resident									
Cancer Inhalation Risks (per million individuals)	4	0.9	1.1	1.7	1.9	2.5	4.0	4.4	5.8
Chronic Non-cancer Inhalation Hazards Indices	0.009	0.015	0.019	0.009	0.01	0.013	0.009	0.01	0.013

1 L/kg BW-day = Liters per kilogram of body weight per day

2 286 L/kg BW-day for the off-airport adult resident corresponds to a 70 kg adult breathing 20 m^3/day for a 24 hour day. 20 m^3/day is the breathing rate recommended for an adult resident by U.S. EPA, (1989).

Most estimates are rounded to two significant figures to show small differences among some scenarios. Typically risk estimates are rounded to one significant figure to be consistent with uncertainties in these values.

Source: CDM, 2009.

Varying exposure duration and inhalation rate for the adult resident would not materially affect conclusions about the impact of the Bradley West Project construction. The highest cancer risk for an adult resident identified in Section 4 is 4 in one million. Using the upper end of the range of inhalation rates for the adults only increases this estimate to about 6, or about 50 percent. This increase does not change the conclusions regarding potential impacts of the project.

Highest chronic non-cancer HIs for adult residents under the Bradley West Project also show very little change as result of different assumptions for inhalation rate. Again, chronic non-cancer hazards might increase for residents by about 50 percent, and would remain substantially below the significance threshold of 1 in all instances.

5.4 Uncertainties Associated with Toxicity Assessment

A potentially large source of uncertainty is inherent in the derivation of the CalEPA toxicity criteria (cancer slope factors and RELs). In many cases, data used to develop toxicity criteria must be extrapolated from animals to sensitive humans. For example, the application of uncertainty factors to estimated no-observable-adverse-effects-levels (NOAELs) or lowest-observed-adverse-effects-levels (LOAELs) are typically used to develop RELs. While designed to be protective, in many cases toxicity criteria are likely to overestimate the magnitude of differences that may exist between humans and animals, and among humans.

In some cases, however, toxicity criteria may be based on studies that did not detect the most sensitive adverse effects. For example, many past studies have not measured possible toxic effects on the immune system. Moreover, some chemicals may cause subtle effects not easily recognized in animal studies. Overall, toxicity criteria are likely to protective for most or all exposed populations. These criteria are constantly being reconsidered in light of new research and are subject to occasional change during this process. The nature and direction of these changes cannot be predicted and currently available criteria are the best source of toxicity information for use in health risk assessments.

5.5 Uncertainties in Risk Characterization

5.5.1 Uncertainties in Acute Hazard Estimates

TACs selected to evaluate acute hazards associated with construction-only impacts for the Bradley West Project were selected from the list of TACs of concern prepared for the LAX Master Plan Final EIR[41] and subsequently refined as described in Section 4.5.2.4 of the Bradley West Project Draft EIR. The refined list of TACs included only TACs for which acute RELs have been developed by OEHHA. Estimation of potential acute hazards for the Bradley West Project using only acute RELs developed by OEHHA adds additional uncertainty to this analysis.

Acute toxicity screening levels for some of the TACs eliminated from the Bradley West Project acute evaluation are available from the Agency for Toxic Substances and Disease Registry (ATSDR) in the form of published acute minimal risk levels (MRLs) for hazardous substances. MRLs were established to provide a screening tool for public health professionals to use to identify if potential human health hazards exist from contamination at hazardous waste sites. MRLs are often based on animal studies because relevant human studies are lacking. ATSDR assumes that humans are more sensitive than animals to the effects of hazardous substances and that certain persons may be particularly sensitive. Thus, ATSDR recommendations for MRLs may be as much as a hundredfold below levels shown to be nontoxic in laboratory animals. This approach is conservative (i.e., protective) for public health.

Acetone, ethylbenzene, ethylene glycol, methyl-tert-butyl ether (MTBE), and phosphorus were eliminated from the Bradley West Project acute evaluation; however, these TACs have acute ATSDR MRLs. Acute inhalation MRLs for acetone, ethylbenzene, ethylene glycol, MTBE, and phosphorus (elemental) are 26 parts per million (ppm), 10 ppm, 0.8 ppm, 2 ppm, and 0.02 mg/m^3, respectively. All of these MRLs except for phosphorus are high, reflecting the low acute toxicity of these chemicals. It's unlikely that acute hazards associated with these organic chemicals would rival formaldehyde, the risk driver for potential acute hazards. Lack of inclusion of these chemicals in the quantitative risk assessment is not expected to change the conclusions of the acute risk evaluation. Phosphorus in combustion emissions is likely to be the form of oxyanions rather than as elemental phosphorus. The acute MRL for phosphorus is based on the elemental form (white phosphorus), which is not anticipated in LAX construction emissions and Bradley West Project-specific operational emissions. Thus, acute hazards due to phosphorus in construction- and operational-related sources are highly unlikely to be significant.

According to the LAX Master Plan Final EIR,[42] the majority of TACs associated with LAX, including those with toxicity similar to toxicity for the four VOCs identified above, do not contribute significantly to potential acute health hazards. As discussed in Section 4.2.3 of this appendix, acrolein is responsible for the majority of acute hazards associated with operations at LAX and is the only TAC that approaches the threshold for acute effects. Acrolein is primarily associated with aircraft emissions.

5.5.2 Uncertainties Associated with Elimination of Potentially Complete Exposure Pathways

The Bradley West Project EIR HHRA evaluates the potentially complete exposure pathway of direct inhalation of TACs released from the Bradley West Project. However, other exposure pathways, such as exposure to TACs deposited onto soils, could also be important. For example, children might ingest TACs that deposited onto soil through hand-to-mouth activity during outdoor play, or residents who have gardens could ingest TACs taken up from soil into plants. For the Bradley West Project HHRA, based on the multi-pathway screening analysis in the LAX Master Plan Final EIR and other airport HHRAs, inhalation of TACs was identified as the primary exposure pathway, and exposures and risks from inhalation of TACs were quantified.

Other potential exposure pathways were analyzed in a two-step screening process described in Technical Report 14a Attachment B, Section 2.5.3 of the LAX Master Plan Final EIR. In the first step, air dispersion modeling was used to determine potential TAC concentrations in air on or near LAX, and these concentrations were used to estimate deposition of TACs onto soils over time. In the second screening step, concentrations of TACs estimated in soil were compared to the range of background concentrations of these chemicals to determine the relative impacts of deposition from air. This analysis indicated that impacts to soils from deposition of TACs from airport operations would be negligible and that the estimated contribution from LAX emissions would make no measurable difference in expected background concentrations of metals. Therefore, secondary pathways involving TACs in soil were not further evaluated.

5.5.3 Uncertainties Associated with Potential Overlap of Bradley West Project Construction and Bradley West Project-Specific Operational Activities

Although the construction and operation periods of the Bradley West Project would overlap for approximately two years (2013 and 2014), combining cancer risks estimates from these two phases is not reasonable, since it would assume that both construction of the Bradley West Project and post-construction operational changes would co-occur for 70 years. As mentioned above, construction of the Bradley West Project would require only approximately 5 years, while Bradley West Project-specific operations would continue for an unspecified period of time until construction of other airport projects would require operations to change.

However, to check the potential sensitivity of the risk calculations to this time overlap, the emissions from both Bradley West Project construction and Bradley West Project -specific operations were combined on a grid point basis and risks and hazards were calculated for the resulting emissions. These risks and hazards are summarized in **Tables 11 and 12**. This overly conservative approach shows that even with this impossible combination, risks and hazards for the combined construction and operations of the Bradley West Project are still below the thresholds of significance. All calculations are provided in Attachments 3 and 4.

Table 11

Incremental Cancer Risks and Chronic Non-Cancer Health Hazards for Maximally Exposed Individuals for Combined Bradley West Project Construction and Bradley West Project-Specific Operations

Receptor Type	Unmitigated	Mitigated[2]
Incremental Cancer Risks[1] (per million people)		
Child Resident	1.6	1.6
School Child	0.14	0.14
Adult + Child Resident[3]	6.6	6.4
Adult Resident	5.5	5.3
Adult Worker	4.0	3.8
Incremental Non-Cancer Chronic Hazards[1,4]		
Child Resident	0.11	0.10
School Child	0.0099	0.0089
Adult Resident	0.033	0.030
Adult Worker	0.032	0.025

1 Values provided are changes in the number of cancer cases per million people exposed as compared to baseline conditions. All estimates are rounded to two significant figures to show small differences between unmitigated and mitigated conditions. Typically risk estimates are rounded to one significant figure to be consistent with uncertainties in these values.

2 Total includes unmitigated emissions for Bradley West Project-specific operations. Because mitigation measures only address PM10 emissions, projected air emissions for Bradley West Project-specific operations after mitigation were not modeled since the unmitigated risks and hazards for this scenario are below the levels of significance and primarily attributable to VOCs, which would not be affected by the proposed mitigation measures.

3 Includes exposure to TACs released from LAX from childhood (ages 0-6) through adulthood (ages 7-70).

4 Hazard indices are totals for all TACs that may affect the respiratory system. This incremental hazard index is essentially equal to the total for all TACs.

5.6 Uncertainties in Background Estimates (MATES-III)

Risks from MATES-III were calculated based on monitoring data collected from April 2005 through March 2006. Modeling during the MATES-III study was used only to characterize existing risk within the basin -- not to project what future concentrations and risks would be. As such, comparisons between project-related estimated risks with the MATES-III results must be interpreted in recognition of the different time periods being represented. One may surmise that basin-wide cancer risks would likely increase in time with the inevitable increase in mobile sources along with population growth. On the other hand, currently adopted emission standards for mobile sources will tend to push future TAC emissions downward. It is not known at this time to what extent these two conditions would offset one another.

However, according to the CARB data, carcinogenic risks due to many TACs have decreased 44 to 63 percent since 1990. If continuing progress is made toward reductions in TAC emissions in the South Coast Air Basin, MATES-III could over predict potential background risks for year 2007 and beyond. If this is true, however, the traffic component of the air dispersion modeling for LAX emissions is likely to be too large also. Progress toward decreasing TAC emissions in the South Coast Air Basin must focus on mobile sources, which are the major contributors. Reductions in mobile source emissions would affect emissions from both airport and non-airport related traffic. Overall, the effect of general reductions in mobile source emissions could increase the relative contribution of LAX to basin-wide risks, but any such increase may be tempered by effects of general reductions on LAX-related traffic.

Unfortunately, trends are not available for diesel particulates because these compounds were not previously monitored. Diesel particulates have been found to contribute about 84 percent of the carcinogenic risks in the South Coast Air Basin. Mates-III provides no information to help determine whether estimated risks would increase or decrease in the future. Again, and importantly, any general decrease in diesel emissions would also reduce diesel emissions in LAX-related traffic. Since diesel emissions were also a major contributor to LAX-related cancer risks, changing background as a result of better control of diesel emissions may not greatly affect the LAX contribution to basin-wide cancer risks.

5.7 Uncertainties Associated with Evaluation of Cumulative Acute Non-Cancer Hazards

The semi-quantitative evaluation of acute hazards performed for the HHRA must be interpreted with great caution. The process included taking a range of possible annual average concentrations from USEPA estimates, subject to high uncertainty, for census tracts in the study area, converting these values to 1-hour maximum concentrations, and comparing these estimates to 1-hour maxima from modeling of LAX emissions. Each of these steps compounds uncertainties and resulting comparisons can only be viewed as a general assessment of relative impacts. Methods used could substantially overestimate the contribution of LAX operations. Estimated cumulative hazards cannot be used as estimates of actual cumulative acute hazards for any locations around LAX.

Recent studies suggest that predicted concentrations of acrolein in air associated with LAX operations may be over-estimated. Acrolein is unlikely to be transported over long distances because of its high reactivity and estimated short half-life in air. A study at Chicago O'Hare Airport used empirical measurements of acrolein in ambient air to determine that acrolein was not a significant TAC associated with airport operations. The Illinois EPA measured airborne levels of various air contaminants in the vicinity of the O'Hare Airport as well as at other locations in the Chicago area over a seven-month period in 2000. An objective of the air toxics monitoring program was to determine if emissions associated with O'Hare Airport had a measurable impact on air quality in areas adjacent to the airport. Acrolein was not reported at measurable levels in air at locations near the airport during the air toxic monitoring program.

5.8 Interactions among Acrolein and Criteria Pollutants

TACs that act in similar way to produce toxicity may cause additive, or even greater than additive, impacts to human health. Acrolein and criteria pollutants, such as oxides of nitrogen and ozone, all act as irritants to the upper respiratory system. Thus, interactions among these chemicals are possible. Whether such interactions actually occur, and are important for emissions from LAX operations, cannot be ascertained with available information. Many uncertainties exist, including:

- Reliability of acrolein concentration estimates (see Section 5.7).
- Lack of information on specific mechanisms of toxicity for the chemicals in question, which will affect the potential for and degree of any interactions.
- Lack of information on thresholds at which interactions may occur.

Without extensive additional research, the potential for impacts related to interactions among acrolein and criteria pollutants cannot be further assessed.

Cancer Risk and Chronic Non-Cancer Hazard Calculations for Bradley West Project Construction Activities

Table 3 1A
Risk Calculation for LAX Bradley West Construction, Horizon Year 2013, 2008 Baseline Lifetime Exposure Unmitigated
(Based on Peak Location of Residential Cancer Risks[1])

Exposure Parameters	Residential Child	School Child	Residential Adult
Inhalation rate	15 (m^3/day)	6 (m^3/day)	20 (m^3/day)
Exposure Duration	6 (years)	6 (years)	70 (years)
Exposure Frequency	350 (days/year)	200 (days/year)	350 (days/year)
Body Weight	15 (kg)	40 (kg)	70 (kg)
Averaging Time (non carcinogenic)	2190 (d)	2190 (d)	25550 (d)
Averaging Time (carcinogenic)	25550 (d)	25550 (d)	25550 (d)
Conversion Factor	1 00E 03 (mg/ug)	1 00E 03 (mg/ug)	1 00E 03 (mg/ug)

		Toxicity Criteria				Cancer Risks				Hazard Quotients		
TAC	Concentration at Location w/Maximum Risk (ug/m^3)	EPA Inhalation Slope Factor $(mg/kg\ d)^{-1}$	CalEPA Inhalation Slope Factor $(mg/kg\ d)^{1}$	EPA RfDi (mg/kg d)	CalEPA Proposed REL (mg/kg d)	Cancer Risk to Child Resident	Cancer Risk to School Child	Cancer Risk to Adult+Child Resident	Cancer Risk to Adult Resident	Hazard Quotient Child Resident	Hazard Quotient School Child	Hazard Quotient Adult Resident
